Hi Max

No, there's not a setting for that. There is one to turn the tuner on or off, but that's all. I have 2 of the '450SAT's here and the good one will tune an antenna in just a few seconds. I even tried it last night, tuning my 80 meter dipole on 40 and it tuned it right quick.

On the bad one, I tried to tune my 80 meter vertical, which is cut for 3.550 on 3900 and it wouldn't tune. The SWR indicator would go way down, and I thought it would quit, but then it would go right back up again.

On manual, it tunes fine. 73

Hi Max.

Yes, it does emit the beeps when on too long. I also tried tuning with the carrier level up or down. Samo samo. 73

Sounds like that isn't the problem then as we already know. Good luck figuring it out. Clif at Avvid Electronics is the man if you have to send it in for service.

It doesn't have the range for that, 3-1 max is all it will tune. Turn off the tuner and see what the internal SWR meter shows the SWR to be, probably close to 10-1.

Ooooooops.....I stand corrected! I have a story about the TS-450S/AT tuner. A friend of mine used mine in C6 for a CW contest. He was able, somehow, to tune my 40 meter dipole to operate on 80 meters. Well, that didn't last very long. Fried the tuner and I had to buy a new one. I learned my lesson. If you need a real match, get one. I use mine to tune the input between the transceiver and my amp. That is about it.

Hi Clif

Is there a difference tuning in the manual mode and the auto mode on these tuners? I seem to be able to tune the SWR down with the manual mode.
Thanks and 73

I have found that the internal tuner will tune in a
much larger range that than. It has tuned most
antennas I have thrown at. Tunes my HQ-1 miniquad on
12 and 17, where it isn't resonant, and will tune my
homebrew G5RV type dipole on all bands 80-10. Most of
the newer internal tuners would not tune this antenna
on 40 and 80. THis is one of the best internal tuners
out there, which is one reason I went looking for a
TS690SAT.

Tom, I had the same problem on one of my 450's on 20M. It would tune manually, but it would not auto-tune. The problem turned out to be a stuck relay on the filter unit. When I pulled a couple of relays to check them, they all tested good. When I put the radio back together, everything started working and it hasn't acted up since. My father-in-law had fussed with this problem for several years before he gave the rig to me.

Try rapping on the relays with the handle of a screwdriver and see if that clears up the problem. If that doesn't work, start pulling them.

Regards,
Ed

No difference in tuning but you may stop at a higher SWR than the
tuner will stop at automatically. Typically they won't stop for less
than 1.2-1, some are even more picky.

I know they will tune a larger range than that but if you stick with
that range the tuner will last longer.

Think about it, you have a high SWR antenna and the tuner matches it.
The radio is happy and pumps out 100w. Now 80 of that may be coming
back down and guess what component gets to eat the 80 watts of
reflected, the poor old tuner. You may get by with it for a while
using only SSB but don't try AM, FM, or RTTY.

'nuff said.

Clif, is right....read my earlier thread about a friend who tuned my 40 meter antenna to 80 and then proceeded to send high speed CW in a contest. Completely fried the tuner.

Isn't that why we should ground our rigs really well - excess reflected

power shouldn't get back to the tuner...it should all

go straight to ground..long before getting to the ATU stage.

What do you think ? that's how I see it.also, if your equipment is well

grounded then there will not be an issue with rf feedback distorting

the audio - no stray rf hanging around the atu.or anywhere else.

73

John

Tom, in theory, you should always be able to manually tune to a lower SWR than the auto tuner. This is because a servo system begins to hunt if its error voltage goes to zero. It must have a small, but non-zero error voltage to be stable.

How much you can improve on the auto setting would be a good topic for an experiment.

Would you be so kind as to show me the magical path the reflected
power is routed to ground through? If all reflected power were routed
to ground before the tuner we wouldn't need the tuner because there
would be zero reflected power.

Nothing was said about distorted audio or RF floating about the shack.
The problem is components in the tuner having to dissipate more power
than they are rated for.

Hi Ed

Well, this is the problem. My 80 meter vertical is cut for 3550 and if I move off to 3650, it will tune it, but if I go up to 3950, it just keeps trying to find a match. Eventually it just starts to beep and then I shut if off. It seems to go way down to 1.2 or 1.3 to 1, but doesn't stop there, just shoots back up again. Manually I can tune it down to nothing.

I have another '450SAT and it will even tune the 80 meter vertical on 40 in about 10 seconds.

I didn't get to play with it this weekend as I had to work and didn't feel like messing with it :-) 73

Date: 2007-05-25 20:46:39 UTC
From: Allan
Topic: 5973 Message: 5973

Hi all,

Sorry for my post not concerning directly the ts-850 .

I look for on internet but don't find any answer about this question.

Is it possible easy for changing the voltage of the dsp-100 (120 volts to 220/230 volts) ?

There is just a switch to turn on some power-supply or a easy system like on the tl922 ; maybe this is a easy system too ?

I live in Europe and I find one to buy from USA.

Many thanks for any answer,

Regards

Allan

Have you checked the manual. I thought it got its power (12 v dc) from the radio connections.

obviously i do not have one, but I do have a manual (available online as well)

Topic: 5973 Message: 5975

Hi to all,
checked my DSP-100, there's no switch for
selecting the voltage. Behind is a label stating -
220 - 240V 22W unit. I think that the model must
be made for 220 or 110V. Alan, I hope you'll get
cheap DSP from USA - there is posibility to
use 220/110V transformer infront of the DSP.
Ask your electrician.

Hello,

I have more then maybe 1w (1 led diode) out on all bands with AT, and maybe little more without AT (2 led diodes).

Has someone experienced the same problem? Any help? Is possible that power amplifiers transistors are dead? How to check?

Thanks
Samir

5979. Re:Wanted info about dsp-100

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-05-26 12:28:23 UTC
From: Janez Celarc
Topic: 5973 Message: 5979

I forget to tell, the unit is quite hot,
so the DSP-100 internal power supply is on
upper edge of his amps.
I didn't open the unit - so perhaps the switch
is inside??? I was check the Service
manual - the power supply is on
page 43 - no voltage switch in the diagram.

Off topics: The computer interface is connected
to the CONT OUT on the DSP-100 - since this port
is used on TS-850 (with cable to DSP-100).
I have slow laptop computer and sometimes with
the DSP-100 he need more time to get the infos
from it, this cause error in N1MM logger.
If the interface is connected direct to TS-850s
this error is usualy not present.

Hope this helps...

It changes the "IF OUT" connector on the rear of the radio from "IF output to spectrum analyzer" to "RF output for the transverter". You cannot use the IF OUT connector as a spectrum monitor until you switch the cable again.

Zack,

Does it mean that I not need to move back coax from CN25 into CN26 for use on HF if I never use spectrum monitor? I can leave ts-850s in transverter mode and use it on HF? When I use it with transverter, I only need to put 12V in IF OUT, no need for opening the radi, right?

Thanks

5986. TS-850SAT broadcast birdies

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-05-29 19:39:27 UTC
From: Rob Frohne
Topic: 5986 Message: 5986

Hi Everyone,

I have a TS-850SAT that has since I got it, had broadcast birdies at various frequencies. For example, I can hear the local station at 1490 KHz at 7240 KHz. I cannot hear any birdie in either my R-4C or my KWM-2. I saw the following note on mods.dk, and thought, "Aha! This should solve my problem." Alas, it didn't. I took all the diodes out for the lower frequency filters from 0-2.5 MHz with no change. Have any of you out there had these problems? Any cures?

Thanks & 73,

Rob, KL7NA

Article follows:

Symptom: The receiver is full of images across the entire HF spectrum. Images of broadcast stations are heard throughout HF bands.

Cause: Static damage through the antenna input, causing diode failure common to other receiver faults listed here. The inductor mod listed elsewhere here is recommended.

Fix @RF Board: Check replace D16 on the RF unit. You may also have bad ones at D3, D4, D5, D17.
Check also for failure at IC-1, 74LS145 band decoder chip. Check this with a DVM on the band filter select outputs, making sure only one output is near 0v at any time.

It has a different center freq than the filters that are not on the
board. It won't work in the older solder-in radios.

From: ei3gsb
Topic: 5989 Message: 5989

I'm looking to buy a TS-690, anyone selling or know of anyone selling a 690? I have a 450SAT, is it an easy job to remove the Auto Tuner and put it in a 690S?

Cheers,
Andrew EI3GSB

5990. FS: Kenwood YK88C-1 500hz CW filter

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-05-31 00:08:38 UTC
From: John Geiger
Topic: 5990 Message: 5990

I have for sale a Kenwood YK88C-1 500hz CW filter
which fits in the 570/930/940/950/450/690/850 models.
Really helps narrow down the passband on CW and the
digitial modes. Works fine, I just replaced it with
an INRAD CW filter in my TS690. These go for $130 new
plus shipping, I am asking $75 shipped. I can take
paypal or MO.

5991. TS-850S/ Dead TX (1-2w out)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-01 06:43:03 UTC
From: Samir Popaja
Topic: 5991 Message: 5991

Hello,
Thank you for reading this.

I have the TS850 that is dead in TX, the power output is about 1-2 watts in all bands and modes, the power supply meter says 7 Ampers at 13.8V volts. No ALC at all.

Has someone experienced the same problem? Any help? Is possible that power amplifiers transistors are dead? How to check? Any idea for begin the troubleshoting.

Thanks
Samir

5992. Noise on receive about S-2 on 26/27 mhz ??

5998. TS-450 vs. IC-706

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-01 22:07:40 UTC
From: kjtwlf
Topic: 5998 Message: 5998

I'm brand new to this group and hope this question hasn't been discussed previously (I searched and didn't find anything very recent): I have a TS-450 and am thinking about adding a dual band FM radio to my collection. I'm wondering if I might be better off selling the 450 and buying a new IC-706 which would, apparently, cover all bases. What I'm wondering is if the IC-706 lacks something in the HF bands that the 450 has. Is the 450 a better HF rig than the 706?

Any opinions?

-Ken

I think you will find the TS-450S is head and shoulders over the IC-706 in terms of HF performance. That being said, it all depends on what you are going to do on HF. If you are a casual operator, the 706, like most radios out there will be fine. I read reviews frequently where someone hears a signal with one radio and another same generation radio can't hear it on the same antenna. I always feel like the latter rig is broken. I haven't found that much difference in the real world. Now, if you are operating in crowded band conditions, contesting, etc., that is a story for another time.

I think the 450/690/850 line of radios are the best. Maybe rigs that cost four to ten times as much are better but they aren't that much better in my opinion.

6000. Re: [TS-850_450_690] TS-450 vs. IC-706

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-02 04:55:15 UTC
From: John Geiger
Topic: 5998 Message: 6000

I agree with this. I have a TS690SAT (a 450 with 6m on it) and briefly thought about selling it to get an Icom 706MKII so I would have 2 meters and 100 watts on 6m instead of 50, but I just couldn't do it. I have had all 3 versions of the Icom 706, a Yaesu FT857, a Yaesu FT897, and a Yaesu FT100D. The 690 blows them all away, with the exception of the FT100D. THe 690 is better, but the improvement is less noticable.

I ran the 690 in the CQWPX contest last weekend and was very pleased with its performance. I have a narrow CW filter at both IFs, and when I put the 270hz filter (455khz IF) in line you really get single signal reception. The receiver on the 690 handled the contest conditions with no problem. I never heard any IMD products or things like that. The 706/857/897 would not have done the same. I ran a 706MKIIG in the RTTY roundup a couple of years ago and it was unusable on 20 meters. The receiver just collapsed completely, making almost every signal unreadable.

Also, the NB in the 690 is one of the best ones I have seen. It removes most of the line noise I have, and it doesn't hurt receiver performance. You don't hear CW signals 5khz away coming thru as raspy static. The only other NB I have seen that was that good was on the TS2000.

The internal tuner (unavailable on the 706/857) is much better than current internal tuners. Loads up anything you throw at it.

Now since I am a 6 meter addict who has no plans of going to rehab, you should trade your 450 for a 690. That would be one big advantage of a 706/857/100D, you could get on 6m, but you would be making a big compromise performancewise on HF.

If you must get a HF/VHF/UHF rig, get the Yaesu FT100D. The others are junk compared to it.

Let me also mention that the 450/690 has awesome
sounding receiver audio, much better than you will get
out of a 706. I am not a hi-fi SSB guy, but the 690
is a pleasure to listen to on SSB. The only rig I
have had which sounded better was a Kenwood TS850SAT.

Topic: 5998 Message: 6004

As an owner of both a TS-850 and an IC-706MK2G, but not a 450/690 owner, my comments may be of lesser value, but specs I have seen show the 450/690 to have a much stronger front end, i.e. much less front-end overload, better dynamic range, and better intermod characteristics. (Better in crowded band conditions)

The IF filtering optons are better in the Kenwood also.

Also that line (450 & 850) have better and more adjustable transmitter audio.

The things the Icom 706 (which I do own) has over the others are:

1) 6 meter and vhf/uhf coverage
2) much smaller size and remotable head for mobile applications, (but you pay a loss of performance to get the smaller size)
3) TX carrier insertion point can be shifted to fine-tune and enhance TX audio
4) Audio level receive DSP for noise reduction (auto notch filter is OK, but ssb noise reduction is somewhat lackluster)

If you are just interested in HF operaton and only want to add FM on 2m/440 then I would say get an icom 208 (I have one of those, too) or some other dual band FM rig. They are cheap and you can have both on at the same time for dual monitoring.

If your shack space is limited and/or you want to add SSB on 6, 2 & 70cm, then the 706mk2G is a very attractive rig for the price.

I have been very pleased with the IC-706 on 6 Meters SSB.

Hope this adds light to the situation,

73 de Ken - NM9P

Not even in the same ball park so to speak. Having owned a 706, MKII and MKIIG at one time or another I speak with experience. If you are looking for an all band/mode rig, the 706MKIG is hard to beat. But for straight HF operation the 450 is very good. Not quite as good as the 850 but still holds its own.

Topic: 6007 Message: 6007

You guys were so helpful with my last question, I can't help asking another:

I'd like to buy a multi-band vertical antenna to run with my TS-450 on 10 to 40 (maybe 80 ?) meters. Anyone have an opinion as to which antenna models are better than others?

I've read on-line review of several models (R7000, GAP Titan, Comet CHA-250B) and for every "excellent" review there seems to be a "really bad" review. Hard to figure out.

Thanks,
-ken

Here's my .02 Ken,

I use a Cushcraft R7 mounted just above the eaves at 15'. It requires no ground radials, the counterpoise is made up of 7 four foot rods that mount at the base. It has been up two years with no problems whatsover. The SWR isn't as broad on 40 as I would like but the 850's tuner takes care of that, and of course it doesn't cover 80m but I have an inverted V for that band. It is prone to picking up noise as all verticals will, but for DX it is a great antenna. Worked the Vatican, HV0A on 20 RTTY yesterday through the pileup. It pretty much works everything it hears, although I would prefer a beam at times. But for $76, (yep that's what I paid for it!) I can't go wrong.

Here's my .02 Ken,

I use a Cushcraft R7 mounted just above the eaves at 15'. It requires no ground radials, the counterpoise is made up of 7 four foot rods that mount at the base. It has been up two years with no problems whatsover. The SWR isn't as broad on 40 as I would like but the 850's tuner takes care of that, and of course it doesn't cover 80m but I have an inverted V for that band. It is prone to picking up noise as all verticals will, but for DX it is a great antenna. Worked the Vatican, HV0A on 20 RTTY yesterday through the pileup. It pretty much works everything it hears, although I would prefer a beam at times. But for $76, (yep that's what I paid for it!) I can't go wrong.

The Comet antenna got a pretty bad QST review, and the
Gap antennas are butt ugly and overpriced. The
Hustler verticals have been around forever, are simple
construction, and reasonably priced.

Until recently I used Hustler because of my small city lot. Bought the 5-band version but only had room to put radials for 20/15/10 and then only on one side as it was at back of lot in the trees. It worked very well - worked considerable DX from Connecticut including one VK station. Moved 1500 miles to much larger lot and use skywave loop now but Hustler is up and hooked to my backup rig. If it (Hustler) breaks, will buy another one.

I hate to say this but the word on verticals is they work poorly in all directions. That being said, my first HF antenna was a 40 meter dipole and a Cushcraft R-4. This antenna had 10/12/15/20 meters as I recall. It worked great. I think I upgraded it to the R-5 with a kit that enabled 17 meters. This antenna eventually went to C6 and lasted for years in that environment.

I replaced it with the R7. I thought it did a good job too. I am a CW op and wanted 30 meters. It didn't do a good job on short haul 40, etc., which you would expect it to anyway.

I upgraded to the R-7000 and then the trouble started. CC had all kinds of issues with these antennas. And I lived them all. There were troubles with the traps, dimensions, etc. Plus, when the antenna flexed in the wind, the windings on the traps would work loose from the screws causing intermittents. It was nightmare. I rebuilt mine using different screws, etc., etc. It was always a pain in the ass.

If you have the room, I would opt for a wire antenna of some sort for close haul. Try and find an R7 for DX. They are out there. I found mine worked best mounted at least 15 - 20 feet off the ground.

Read the Eham reviews too. There is a new vertical by Hy-Gain that people seem to like. It is a half-wave design and requires no radials.

Verticals are very controversial and you won't get the same story from anyone. I will tell you when I put up my first yagi, it was incredible.

But, if you are a CW op or run PSK, RTTY, a vertical will do a good job.

Holy Cow! You've opened the preverbal Pandora's Box, vertical antenna performance. You did have a bad run with your R-7000. I wish you had mine.

Remember, traps are lossy, whether in a dipole, yagi, or vertical.

I've had my R-7000 up since 1995. It has been taken down for use in Field Day each year and dozens of Boy Scout campouts in 12 years. The only problem I had was the stainless steel U-bolt and nuts froze and I had to get replacements from Cushcraft. I find the R-7000 to be a tough durable antenna. I run 800 watts to it from an AL-811H amp.

This is a good antenna for DX. My first contact with it in 1995 was to Pitcairn Island with 100 watts. Last year I contacted Antarctica using my K2 at 5 watts. I agree, verticals suffer ground losses and are generally poor performers in all directions compared to a dipole or yagi, but Antarctica on 5 watts from an R-7000 is good for poor performance.

I've had my R-7000 mounted in a 3 foot Radio Shack tripod for portable operations, 2 feet above the eves of my house for fixed operations, at roof level on my travel trailer, and it is currently mounted 8 feet above ground. All mountings have given me good performance.

The antenna flexes in the wind, but verticals need to flex or they will break in high winds. Case in point, I had the R-7000 mounted on top of a 30 foot telescopic mast at the side of my house so the antenna was 2 feet above the peak of the roof. The mast was bolted to the house at the roof peak. We had a "straight line wind" similar to a tornado except it does not swirl, hit the metro Phoenix area several years ago. The R-7000 survived with no damage, but the mast, 1.5" in diameter with a wooden dowel inside, was bent 90 degrees where it was bolted to the house. I lost the roof of my house in that storm, not just the shingles, but the plywood, too. That's a tough antenna.

I would like to get another R-7000 to leave in my camp trailer.

My other antenna is an 80 meter dipole bent at the ends to fit my city lot. It is supported by two 50 foot telescoping masts, 2 inches at the bottom and 1 inch at the top. The flat top measures 70 feet across the top and the verticals ends are about 30 feet long each. I feed this with ladder line and use an antenna matcher to work 10 - 80 meters.

Even for CW a yagi (even a small one) will beat the heck out of a vertical or dipole. My DX totals really went up when I installed a Cushcraft MA5B. Now use a Mini Products HQ-1 miniquad and it is also a great performer. Much quieter than the dipole I use on the low bands.

One thing to remember is that the performance of a vertical does depend on the frequency you are using it at. Verticals are the antenna of choice for the low bands (160/80/40) as they have a low angle of radiation, which makes them good DX antennas. To get a dipole to have a decent low angle of radiation, and the bidirectional pattern characteristic of a dipole, it needs to be at least 1/2 wavelength above the ground. This is difficult to do at the low bands, since you are talking about 65 feet above the ground for 40 meters, 130 feet for 80, and 260 feet for 160. Most of us can't get our antennas up that high, so the ground lose you have with a vertical is still worth it because you are focusing your power at a low angle of radiation.

Now when you get to the higher bands, dipoles become more practical since 1/2 wavelength at 20 meters is only 33 feet, which is practical for most of us. A dipole is around 95% efficient, so very little power is being lost with the antenna, unless you are trying to feed it on non-resonant bands and using coax, especially RG-58 or RG-8X due to the coax loss that comes with a high SWR. A vertical is going to be less efficient than a dipole, so you are getting less power out. Then you have the loss with traps, etc.

One of the best ways to learn about antenna performance is to spend $17 a year, subscribe to World Radio, and read the aerials column each month by Curt N Sterba. The propagation column by K9LA and the occassional receivers column by W8JI are also worth the price of admission alone.

6017. TS450/690 vs TS570

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-03 23:45:19 UTC
From: John Geiger
Topic: 6017 Message: 6017

While we are on the topic of comparing rigs, has anyone had the opportunity to compare the 450/690 to the TS570? I currently have a TS690 (love it) and also had one about a year ago. I briefly had a TS570D a couple of years ago, but never had a 690 and 570 at the same time, so I couldn't directly compare them.

Based on what I remember about the 570, it seems that the TS690 has a much better receiver in it. Kenwood sure seemed to fall down on the 570 design by including only 1 optional filter slot. Is the 450/690 a much better receiver? The TS570 does have some features I wish the 690 had, like a built in memory keyer, and the ability to add the DRU3A voice keyer.

6018. Re: [TS-850_450_690] TS450/690 vs TS570

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-04 12:55:08 UTC
From: Tom LeClerc W1TJL
Topic: 6017 Message: 6018

Hi John,

I currently have a 690SAT myself along with a 950SDX in which I just installed the new roofing filter from Inrad. I spent a bit of time comparing receivers between the two both prior and after and they were not all that far apart (pre-filter).

Now previous to this I had a 570 for a couple of weeks (keeping it for a friend while he moved) and had the opportunity to test it against the 950SDX pre filter. It was not near as good as the 950 so by indirect comaprison I'd say the 690 has a better receiver.

Now the roofing filter I just put in the 950SDX might be usable in the 690. Have to see what Inrad says about that. Electrically I'm sure it would work seeing as the receivers are very similar. There just might not be room for it in the case...

Hope that's of some use...

From: Rodrigo
Topic: 6020 Message: 6020

Hello

I have a TS-450SAT and it is been running for about 14+ years (I bought it new). I did relocated it just in case it ever leaks, keeping the original battery, no reason to replace since it showed a good voltage level when I did it.

6021. Re: Which Vertical

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-04 17:30:21 UTC
From: Dave
Topic: 6007 Message: 6021

The performance of all vertically-polarized antennas is seriously affected by your ground conditions out to about 2-4 miles from where the antenna is mounted. If you have poor ground, then your only choice is to copper-plate your entire neighborhood, or elevate the antenna a half wavelength or more. On 80 meters, that gets to be a real challenge.

Now, a low dipole is also affected by the ground. If ground is poor (absorbtive), then the dipole efficiency drops readily to 50%. If the ground is good (reflective), then the dipole radiates straight up.

So there's this odd seeming paradox. If you have lossy soil, then a low dipole may be a better DX antenna than an on-ground vertical. And, if you have lossy soil, the low dipole will be very poor at NVIS. On the other hand, with good soil, the vertical becomes a good DX antenna and the low dipole a good NVIS antenna.

My only experience with verticals is home-brew and a Butternut. I ran an elevated 20 meter full-size vertical with tuned radials and was pleased for DX work. My Butternut HF9V, elevated the same amount and on the same tuned radials, worked exactly as well.

The Butternut is doing so well that I have discontinued the use of my homebrew full-sized verticals. I consider my station modest - a cheap amplifier with the TS-850 and the vertical is my DX station. With that, I worked 130 countries in about 8-10 hours of the CW Worldwide Thanksgiving weekend contest, most of them on 40 meters. I"ve got the antenna mounted at about 12 feet high with four tuned radials for each of 80, 40 and 20 meters.

I would be more concerned about it leaking all over the digital board.
For the amount of time it takes to relocate and or replace I would
seriously think about it. A new battery cost a lot less than a digital
board or service to repair one.

Hi Curt,

I have had problems with RFI getting back in the audio cables from the computer to the TS-850 when running high power (usually SSB when the cables are still hooked up). I also found the best IMD setting was actually driving the TS-850S at about 100 watts, rather than lower power which surprised me.

Curt,

I've been using my 850 on PSK and other digital modes for years. For the audio digital modes I feed the computer LINE OUT and MIC IN signals to the 13 pin DIN on the back of the radio. I run the signals through isolation transformers and have no problem at all with feedback. I have in the past used RigBlaster's but this works just as well. For keying I built an interface from AA5AU's RTTY website. All you need are three transistors and three resistors and a serial cable. One transistor keys the PTT line, one keys the FSK line for RTTY, and the other keys the CW line. I use MixW for the audio digital modes and MMTTY for RTTY work. I am just finishing off another PC to radio interface to computer control of the 850, great for logging and DX spotting. If you have any questions drop me a line off board.

Max

I too have used the TS-850S on the digital modes. I run RTTY with MMTTY in the FSK mode. I have run into a problem with distortion on AFSK. This is a known glitch with the 450S/690S/850S. I too use the DIN jack on the back of the radio for my connections. I have used the Rascal interface for both FSK and AFSK. I use Digipan for PSK-31 as it is free. I believe MixW is about $50.00.

Right now, I am using my TS-870S as my primary rig and I don't run into the audio issues with AFSK.

Hello and good morning from Germany,

been using my 850 in PSK and other digital modes for 6 years.
Interface is homemade with 2 insulation transformers an an
optocoupler.
The transceiver is controlled by a cheap "Ebay-Cable" cost only 15
bucks instead of the original, expensive Kenwood interface. Software
is Ham Radio DeLuxe by HB9DRV (Freeware!), works excellent!
The output in PSK is only 20 Watt!! to get an IMD of -30dB, it is
controlled by PSK-Meter (KF6VSG). I see every day people who has 40-
50 watts out with there 100 watt transceivers, but there IMD is so bad
and produce splatters on the whole band. By the way, PSK is a qrp
mode where 40 or more people use a single SSB channel (2,4KHz)
I´ve 2 INRAD 400Hz-Filters built in in my 850 (2nd and 3rd IF) wich
are much better than the original Kenwood Filters and do a
very good job for PSK. An external DSP is also helpful, I´ve never a
chance to try a DSP-100, but been using a NIR-12. I found that
ONBOARD soundcards are also not so useful for PSK, try a better one,
such as Creative Audigy2 or so, this is a big, big difference to get
week signals decoded in a distorted channel.

Subject: [TS-850_450_690] TS-450S Marker Tone

I just picked up a TS-450S. So I don't all the ins and outs of the
radio. The thing I have noticed is that it seems to be putting out
(what I would call) a marker tone. This is on all the ham bands. It
appears to be on the 20's and 70's and repeats itself. I have not
figured what it is or how to turn it off. I have gone to the menu and
tried and did set everything on reset. But no change. Any one got
any ideas?

Hook the 450 up to a car battery and your antenna. Go to the breaker panel and flip all the breakers off one by one. If something in your house is causing the interference, the noise will disappear when the appropriate breaker is tripped. If you succeed, trace all the circuits fed through this breaker and you may find the offending item. I traced an HF hash to my TV in the living room by doing this.

If you flip all the breakers and the noise is still there, it may be coming from somewhere else in the neighborhood or you may have a problem with the radio. Better to rule everything else out first.

I am selling my 850. S/N 307000614
This rig comes with autotuner built in, YK88CN-1 CW filter, YN88SN-1 SSB filter, hand mike, power cable, Instruction manual, Service manual, Remote manual.
Battery has been replaced, as has the DC-DC board and TRX board.
This rig has recently been returned from AVVID, where Clif replaced all electrolytics on the CAR unit and re-aligned as necessary.
I need a new laptop, so need the money. This ia a wonderful radio.
Only cosmetic item is a previous owner used an etching tool to put his call sign in the top cover....(jeez). This radio was a hit last year at Field Day and should be even better this year. Pictures available upon request. Please contact me off list.

Doyle / K9DEH

Asking $750.00
CONUS only
$40.00 ships it coast-to-coast.

Hi

I've an intermitent failure of AGC, In 18Mhz sometimes I've no audio, with AGC in position OFF I can hear !! but in other position I've RX signal but no audio, it seems a problem in agc board, but any idea?.

Please tell me where is located AGC board, I'll try to verify if there are a component failure.

Xavi,

If this is TS-850, from service manual, AGC is Board X59-3820-00 and is located on the IF Board, X48-3080-00. The IF board is on bottom of radio.

I have for sale an INRAD #103 400hz CW filter for the 8.83 mhz IF, and a Kenwood YG455CN-1 270hz CW filter for the 455khz IF. These fit the TS450/690/850/930/940/950 and the INRAD will also fit in the TS570.

I am asking $80 each shipped.

Hello,can i ask TS-850 users advice please - i am thinking of purchasing a TS-850 which i want to run under computer control using the G4ZLP interface however i notice on the ad for the interface that various of the Kenwood transceivers need the IF10D to be installed into the radio - it also goes on to say that most of the TS-850's do have the IF10D fitted as standard.

Can anyone tell me how do i know it the IF10D is fitted to the radio that i am interested in.

Many Thanks and 73es.

Terry.

My understanding is that the IF10D does not install inside the radio. It connects between the ACC1 connector and the computer's serial port.

The ACC1 connector uses TTL-level voltages to send and receive control signals to the TS-850. You need something to convert to RS-232 levels if you're going to use a computer's serial port.

I just built up a circuit using a MAX232 chip. Pretty easy to do.

no if10d needed for the 850

the 10d was for the ts940 and that era of radio

ts140, 440, 940, and others required the ic chipset AND the if232c interface

Terry,

You do not need the IF10D. A simple MAX232A with a 7404 inverter will do nicely. There is a schematic of the circuit I use in the files section. I just finished building another for my latest 850 and it works great. I mount mine inside the radio where the VS-2 board would go under the hatch. It involves removing the external tuner molex power plug and put a DB9 in its place. Next step is to remove the board with the 6 pin DIN plug (where the external IF232 would plug into) and solder the wires from the converter to the same pins. Power for the circuit is borrowed from the power pins that went to the tuner connector. Very easy to do and now all you need is a serial cable to hook the 850 to the computer.

If anyone is interested I have extra parts on hand and can supply the interface for a small fee.

Hello,thanks for the replies most helpful,this evening i have had a word with one of the semi local stations over here ! he runs a TS-850 ! under computer control he also says that the IF10D is not needed for the TS-850 or at least not for his transceiver.

I will play it by ear when i get the 850 on Monday and see how things work out.

Again thanks for the replies and help.

73es from a very wet West Yorkshire !! we have 4 foot of flood water on the road about 1 mile from here !!.

6054. For Sale: Kenwood TS-940SAT station

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-16 03:13:17 UTC
From: Brian Mileshosky
Topic: 6054 Message: 6054

Hi Everyone -

Slightly off topic since it's a different model number (close counts, right?).

I have for sale a classic and beautiful Kenwood TS-940SAT station consisting of the following: Kenwood TS-940SAT transceiver (6 million serial number) with automatic antenna tuner and built-in power supply, SP-940 matching speaker, SW-2000 SWR/power meter, MC-60 desk microphone, original owner's manual, electronic copy of the service manual, and electronic copy of the SW-2000 manual.

This station comes from a non-smoking environment. The transceiver was calibrated, checked and aligned to specification by Kenwood in 2001. Everything is in great to excellent physical condition. The only quirks to note is that the tiny LCD display sometimes blanks, but tapping it solves the problem -- most likely a dirty connection to the display. The monitor function (a minor function which allows an operator to listen to his own voice through headphones while transmitting) does not seem to function. Everything else works fine.

Price: $800 plus shipping within the United States; may consider shipping to Canada. I'll accept only a money order, preferably USPS money order. Pictures are available if requested. Please email me off-list if interested (serious inquiries only please).

73,

Brian, N5ZGT

I have a TS-450S that I moved to a different set up and changed some antennas. When i fired it up and went to check the SWR it was in constant change , the SWR meter swaying up and down. I checked the cables , lowered the antenna checked it, retried ,kept checking and trying. Problem was the power supply lost regulation and voltage would go high. Power fixed now, but I think I cooked the radio, out put is low and eratic on all modes, some times all drops out. Where is a good place to send it for
repair.

I also own both. I run the IC706 in the truck for HF mobile, but I would not think of using it for FM on 2m or 440. I have a separate dual-band rig in the truck for repeater operation. I have used the 706 for 2m SSB but it does not compare to "real" dual-band rig for repeater operation.

There are 2-3 electrolytic caps right beside the board that have to be changed also.

Hmmm....did those caps once before, might as well do them
again....thanks for the reminder.

Hello,I had the same problem and I did post the answer to the problem several years ago on this group.check your MEMORY BATTERY.one quick way to check the battery is to test the rigs MEMORY FUNCTION.to do this,store a frequency in one of the rigs MEMORY CHANNELS,then verify the frequency is in MEMORY by going back to VFO mode then switching back to the MEMORY CHANNEL you saved the new frequency in.it should be there.now,turn off the radio and disconnect it from the power supply for about 10 minutes.after the 10 minutes has past,reconnect the power supply,and turn on the radio,then select the MEMORY CHANNEL where your new frequency is.if the frequency is not in the MEMORY CHANNEL,the battery is BAD and must be replaced.think about this: the 850 has a CPU MENU of various optional operations which are also saved to MEMORY this is the area that is effected by the MEMORY LOSS and is the cause for the problem you describe after replacing the DC TO DC BOARD.at this point you should inspect and verify the voltage of the battery if the battery has corrorsion on it which indicates leakage,replace the battery and do a reset of the CPU.you can skip the above MEMORY TEST and just check the battery voltage (should be close to 3 volts) and condition.if the battery shows any leakage what so ever, go ahead and replace the battery before it damages the CPU circuit board.don't forget to do a CPU RESET after replacing the battery.73,N4QDE-Larry.

6069. Mounting AV-640 Vertical Antenna

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-23 23:45:28 UTC
From: kjtwlf
Topic: 6069 Message: 6069

After consultation with this group, I bought a Hy-gain AV-640 vertical antenna. It's assembled and sitting on the front deck. I have a question about where to erect it.

I'm going to attach it to a modified A-frame cabin. I thought I'd run a steel pipe from the ground up to the roof line and set the antenna on top of that. There are two fairly obvious places to put it: on the end of the cabin or on the side. If I put it on the end, the pipe would run up to the peak of the roof (~25 feet!) and the antenna would be higher than any spot on the roof and would have an unhindered "view" in all directions. If I put it on the side, I have the option of mounting the antenna lower, but some of its "view" would be blocked by the cabin roof.

The question is, how important is it to get the antenna up higher than the peak of the roof?

You might get more answers if you post this in an antenna group Ken,
but for what it is worth, my R7 sits on top of a 15' mast just above
the roofline, with the peak of the roof to the south higher than the
antenna and it has no effect on the signal whatsoever.

Put it on the end...

With any antenna system, higher is better and blocking is bad.

I have for sale a very nice looking Kenwood TS450SAT 100 watt HF rig with autotuner. The receiver in this radio is outstanding and the autotuner will load up almost anything you throw at it. Everything works fine on the radio, and I kind of hate to sell it, but looking at getting HF and 6m into one radio to make the cables and interfacing easier in the shack.

The TS450 has the manual (original, not a copy) mic, and power cord with it. You will not be disappointed in the way this radio works or looks. I am asking $540 shipped in the US for it.

This last Field day I was jumping around 20, 40, 80 meters and USB to LSB. I found that I would receive the same signal level on both, the same station. Calling a friend I checked out TX and it was fine for both modes. But the receive was the same for both USB and LSB.
Recently I repaired the display by replacing the caps. I was thinking the caps on the CAR pcb maybe going bad causing this rx problem. Any ideas?

Mike,

If you have the filter selection on 6K or 12K you will hear the received station on both sidebands. However when you transit, if you haven't enabled the filters to switch on TX then your friend will only copy you on the appropriate sideband, because your bandwidth is 2.7 Khz at the most. Check which filters are lit on the display on RX.

Just for fun, find a strong signal on a band and set the 455 filter on 12K and the 883 filter on 6K. While listening to the station switch between USB and LSB. You will hear it equally. Now set both your filters to 2.7 and do the same. You will only be able to hear him on the proper sideband.

Why would a bad memory battery have any impact at all on the transmitter's ALC function? The circuits have nothing to do with each other.

OTOH...I turn off the entire shack when I'm not using it, and it often goes weeks without me using it. When I turn things back on and dial up a memory channel, there's the previously-stored frequency and mode, right where it's been for quite a while. So, the memory battery seems fine.

I'm just curious how it could possibly have anything to do with the TX ALC?

I wondered that myself about the alc and battery.

No need to go thru all the gyrations to check the battery. If when the radio is turned on it comes up wherever you left it the battery is OK. If it comes up at 14.000.00 mHz USB the battery is bad.

6083. CW filter compatibility

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-27 18:04:28 UTC
From: ve3tmt
Topic: 6083 Message: 6083

Hi all,

I recently purchased a YK88C CW filter (solder-in type) 500 Hz 8.83 IF for my 850. But I now notice the passband on RTTY has shifted to the point of not being able to copy signals in MMTTY. Also when TX'ing thru the filter on CW and FSK, the output power is greatly decreased. I have a feeling that this filter is not compatible with the 850. I thought the only difference between the YK88c and YK88C-1 was the mounting style, solder-in versus plug-in. Can someone please elaborate?

You can pop the top cover off with a few screws the tuner is on the right ,
you can see the coil and V cap through vent holes or there is a blank hole.
There are two gear drive units for the tuner also that are easy to see.

Also, if not already selected,press"6" (TxM) on the key pad to see the SWR bar graph and make sure that the PWR turned fully clockwise (if your output power is set too low, you will hear some error beeps)...I found this out the hard way (having to recheck my Dipole and station grounds) and the AT TUNE will not work right!

Subject: [TS-850_450_690] TAnt uner?

Pardon the bonehead question, but: How do I tell if my TS-450S has a
built-in antenna tuner? From my reading of the manual, it appears to
be an option. If I transmit with the auto/thru button in "auto",
the "AT Tune" light comes on briefly, but I don't see any reduction in
SWR.

Thx,
-ken

Nope. The YK88C has a center freq of 8830.7, the C-1 is 8830.0. They
are not compatible as you found out. Same for the CN series. The SN
and AM filters are OK, same center freq.

6090. Re:Continuing problems with DC-DC board

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-06-28 12:57:28 UTC
From: Larry & Cricket Nunnery
Topic: 6062 Message: 6090

I am not able to explain how the battery effects the ALC at this writing because the records I keep for this topic are stored away and I haven't had time to look for them but,as best as I can recall the low battery does not directly affect the ALC circuit.the battery finds its way to effect the ALC circuit by stored memory settings that have an effect on the ALC circuit.if those memory setting are effected by a weak or dead battery then it would effect the ALC circuit.before I repaired my 850 ramping ALC problem,the rf output was about 10 watts and the rf level control had no effect at all.so I bought the transistors for the DC to DC board and did the repair.when I turned on the rig the problem was still there.so I bought a new DC to DC board from Kenwood and installed it only to find the same problem.I was discusted and put the rig in the closet.a few months later,I brought the rig back out and tried to transmit on it again but the ALC problem was still there so I decided to use it for a reciever.I found several frequencies of interest and tried to save them in the memory but,that didn't work. so I tried to save changes to the menu set up that didn't work either.I tested the battery and it was dead.I installed a new battery,reset the cpu,and the rig returned to normal,everything worked as it should.that was about 2001 and my 850 is working great today.I am not sure Just which menu settings effect the ALC at this time.when you do the cpu reset,default settings are returned to the menu.and if you don't already know there is a sub menu aswell.the bottom line here is the battery did have an effect on the ALC circuit and by replacing the dead battery MY 850 RAMPING ALC problem has gone and been gone 6 years now.thanks for reading,Larry N4QDE.

From: s58aa
Topic: 6093 Message: 6093

My TS-850S has gradualy lost transmitt power on 28 MHz.

I have now measured output power on dummy load with and without inserted auto-tuner.

Power output is from 90 - 75 W from 1.8 - 24 MHz (cca 10% less with inserted auto-tuner, 80 - 68 W), but only 3 - 4 W on 28 MHz !

Has anyone had similar problem, and what is possible cure ?

73 de Tone S58AA

Topic: 6093 Message: 6094

Check the BPF diodes in the RF unit for leakage. The easy way is to put the radio on 20m. Locate IC1, check the voltages on the pins. Pins 1-7 & 9-11 are the band select lines. Pin 4 should be low and the rest should be 11.2v

Anything other than 11v high and less than 1 volt low indicates leaking diode(s).

> When on 10m are all the rest of the pins listed at 11+ volts???

I have accidently found the solution, but not also cause of the problem.

Measuring all the Y-pins on IC1 (74LS145) when on 28 MHz, pin 6 is low, all others are high, except pin 2 (0.5-1.6MHz). When cutting off pin 2, power on 28 MHz was again full. So I let pin 2 cutted off, and work happily on.

Interestingly enough, if I change the IC1 for another one, nothing changest, still have to cut off pin 2 to get full power on 28 MHz.

Topic: 6100 Message: 6105

Regarding filter manuals - I have the "cut sheets" for the Kenwood plug-in filters YK-88SN-1, YK-88C-1, and YG-455C-1 - they are anywhere from a quarter to half of a sheet of paper. The flip side has the Japanese instructions. No help on screws.

Tracey - probably best to network with local TS-850S owners. If you were in the USA, I'd remove one of the screws and look for several similar length and threaded screws in my junk box (I'm sure there have to be some in my coffee can of tiny screws ;-) and mail it to you.

I don't have a TS-850S service manual but I looked at my TS-940S service manual parts list for the IF Unit (where the AM, 88C(N) and 455C(N) plug-in filters mount). There is a listing for 6 (2 per filter) pan head screws, part no. N30-3010-4A. It may or may not be the same for the TS-850.

Also, the mounting screws don't do anything electrical. The filters mount right side-up and are in no danger of slipping off the the connector pins.

Hope this helps, 73 George Ah6BV/w1

Just as I said, you have a leaky BPF diode. That's why I specifically asked if ALL other voltages were high when on 10m.

Since the very beginning of its usage.

I first read about it in an ancient ARRL Operating Manual (circa 1939)...that text seems to have migrated to Wikipedia, and therefrom I now copy and paste:

"This distress signal was first adopted by the German government in radio regulations effective April 1, 1905, and became the worldwide standard when it was included in the second International Radiotelegraphic Convention, which was signed on November 3, 1906, and became effective on July 1, 1908.

"From the beginning, the SOS distress signal has actually consisted of a continuous sequence of three-dits/three-dahs/three-dits, all run together without letter spacing. In International Morse Code, three dits form the letter S, and three dahs make the letter O, so "SOS" became an easy way to remember the correct order of the dits and dahs. In modern terminology, SOS is a "procedural signal" or "prosign", and the formal way to write it with a bar above the letters, i.e. SOS.

In popular usage, SOS became associated with phrases such as "Save Our Souls," "Shoot Our Ship", "Sinking Our Ship", "Survivors On Shore", "Save Our Ship", "Sink Our Ships", "Survivors On Ship", "Save Our Sailors", "Stop Other Signals", "Sink Or Swim", "Send Out Sailors", "Save Our Skins", and "Send Out Someone". However, these phrases were a later development, most likely used to help remember the correct letters□something known as a backronym."

(end quote)

Another note - ALL procedural or prosigns are supposed to be sent "run together". It is an unfortunate accident that in these days of the internet's prevalence, there is no universal method for placing an overbar above a string of letters - if you go to the Wikipedia website ans search for "SOS", you'll see the overbar in their text - but it did not come in by way of the copy and paste I performed above.

It's also partially the fault of so much computer-sent CW these days, that many have never known, or heard, procedural signals such as KN, AR, SK, AS, sent as a single string without a space, as they are supposed to be sent. I've not got a keyboard sender, so I don't know how they'd do it, but certainly, typing "KN" on a keyboard will not produce "DAHdiDAHDAHdit" as it is supposed to be sent. And, when you listen to QSOs, you are more likely to hear "KN" sent as two separate letters. In fact, in earlier QSTs, KN was indicated as NG, as that would sound identical, when sent properly with no intervening letter

space.

In practice, little of this matters - when "KN" is sent as two
characters, we know what it means....rather like punctuation and
grammar. Perfection is not required to get the message across.

Hi list, im new into this list since i newly got my first Kenwood radio (used) TS-850S. Pretty fine radio i think, listens really fine.
I was playing around with the built in ATU, it wont tune.
I know that the antennas i tested on and on the freqs. i tested on, the swr on the antennas arent bigger than 1.5 (Verticals and dipoles) even if i try against a dummyload it wont tune.
I have checked with my MFJ-949E between the TRX and the antennas, power output is abt. 10w as it should be, i can see on the MFJ the reflected pwr goes a little up/down but the swr indicator on the 850s moves up/down on the whole scale and it just continues tuning the 20 sec. and starts yelling at me.
If i do this with the dummyload on all bands it's exactly the the same output and behavior.
I have tried resetting the radio a couble of times also. If i use the same antennas on my IC-7400 (746pro) i have no problems, have run more than a couble thousands qso's with this setup.

What to do ?

Tks. in advance
OZ1TMK, Torben

Hi Torben,

You need to put the power up to 100 watts to get the auto-tuner to tune
correctly.

Actually it will tune quite satisfactory with 25W. Torben, I know you have performed a reset but there is a menu item that tells the tuner to stop tuning when it tunes below a certain SWR. If you can't find it I will research it for you, but the think the factory default is "ON" so this may not be the issue. Is the radio TX'ing fine with the tuner bypassed? Have you made any contacts? It may be a loose cable on the tuner board?

May I assume you have carrier (CAR) set properly. Mine is set at 6.
My 850 will not tune if carrier set below 5.

This is extremely important! NO carrier (of sufficient wattage) NO TUNE!
You would be surprised the "HAMS" I have seen trying to tune with NO or VERY
LITTLE carrier output! You mention it to them and they look at you as if
you have 4 heads! Just last Field Day I discovered a "HAM" trying to tune
an external auto tuner (LDG) with NO carrier!

Hi all, tks for reply Rob, Dave, Max, Ron and Dave

I have tried with pwr 4/4, 3/4, 2/4 and 1/4, my CAR are in position between 7-8, menu item 20 are set to on, i have no problems running SSB with my MFJ tuner, plenty of psu power (Diamon 30A works fine with other rigs) and yes the switch on back of rig are set to internal ATU :-)

So next task for me is to open rig, check cables and replace battery when i'm there. But of cause "secret menu items" are always interesting .

I'll be back and tks.

Hi Torben,
if you have some external wattmeter - how many Watts durung "Tune" is
going out?
More then 20W?
Just for checking. Turn CAR and PWR fully clock-wise and press "Tune".
What do you see on external wattmeter connected to some dummy load 50Ohm?

If not enough power there then you can set tune-power by internal
trimmer, maybe only this internal setting goes wrong. I hope I remember
correctly this system, sorry if not :-)

Good point Lexa. Regardless of where the CAR control is set it is
possible that there is not enough RF power going out through the tuner.

Hi Tom,
on TS-850 there is VR-6 for setting TUNE power on RF UNIT.
Sorry no knowledge about 450 but should be similar i feel.
Try to look to Service Manual if you have chance.

Topic: 5506 Message: 6129

Hi Clif,

Finally have been home long enough that I got to this. Had some unanticipated business travel over past 3-4 months.

On Final board, driver bias on base of Q6 is 1.3V in Tx, which matches schematic in service manual. Final bias on base of Q7 is 41.6 mv and should be 1.2V according to schematic. Am assuming D3 is bad but while waiting for part, will pick up adjustment tool for VR2 and see if adjustment will make a difference.

Thanks for your help on this. I really appreciate it.

73

Ron - AG1P

Check the bias on the finals and drivers. The base voltages should be
.6-.7v in Tx. Measure in SSB with no mike hooked up. Zero volts
indicates a bias circuit problem while a higher voltage is usually a
leaky driver or final.

Clif

Is there any readable information left on the old component, can you give us a lead to lead location (ie between r100 and antenna connection) there is a schematic in the users manual, that may show it. Is thiis a varistor type???

Torben
Same problem I had. Somtimes it got tuned, esp on higher bands
My solution:
resolder solder points on the filter board.
Perhaps the HF protection is gone, as the picture at this board shows.

Hi Ken

Did you figure out if you have the tuner built in?
I have just bought a 450S through that well known auction site and it was advertised as a 450SAT but now the guy tells me it doesn't have the tuner built in.....Hmmm! Haven't received the radio yet and was just curious to know how you got on or is it still possible to buy the tuner board and fit it yourself

Finding the auto tuner for it will be quite a task if you find it at all. I own a ts450sat and I know how scarce they are. It was advertised as a ts450sat you should go after the seller for fraud. Start with ebay. Are you sure it's not coming with it? By the way I developed a cable hook up to control these without the IF232 black box (which is just so much smoke and mirrors.). You do NOT need the 1F232 to cat control this rig even though the manual says so. Kenwood has been ripping customers of for years selling the IF232 black box and cables. YOU DO NOT NEED IT! Let me know if you would like a free copy of the pinout for the cable hookup. I can and will email it to you. All you need is a din plug and a db9 serial cable. I also have the op manuals and service manuals in PDF format on disk. I can ftp to you if you need it. It is a good rig and I do like it very much! I use it every day. Mine came from a dear friends estate.

Hi Dave, I also have a TS-450 and like you I received it from a very good friend's estate. He told me a long time ago that he was going to live to be 100...But he only made it to age 98 :) Mine does not have the built in antenna tuner. I hope to purchase an external tuner soon.
I am also interested in the information for the control cable. I sure would appreciate the info if you can send it to me. And would the same cable work on the TS-440?

Thanks and 73. Ed, WB3LKO

Dave,

I have sent you a personal request for this hookup. I am very curious how you managed to do it seeing as how the radio and the PC communicate through two different "languages". The circuit in the files section is very easy to build and requires only a few parts. I have built many over the years. It is what I use on my 850. I have spares here and could build 2 or 3 more if anyone is interested. I would only charge for my time.

I think "Ripping people off" is a little strong.

While your circuit may work it probably does not conform to RS232 spec's which call for +/- 12v for signaling. If you build something and it works, great. Your neighbor builds it and it doesn't, Oh well, try again with a different circuit. Not all serial devices are as picky about voltages, some are.

Kenwood built a level converter to convert TTL, 0 & +5 to RS232 spec -12 & +12 Actually they got close -10 & +12. This circuit was designed in the early 80's before the advent of the one chip level converters and has a lot more pieces than needed today, BUT it's in stock and works. Why redesign just for lower price??

Just like the current crop of USB/Serial converters, some work and some don't. Depends on whether or not the output voltages are compatible. RS232 is "supposed" to work down to +/-3v. Your device is a little off tolerance and wants 3.5v and the converter is off the other way 2.8v, and they don't work. I have several around here, some work, some don't. Voltage levels.

Off of soap box.

Clif

if you read my email it says 450s and 690 not 850. I have yet to even looked at the 850. It works very well and ham radio deluxe is a perfect companion and is currently operating on about 20 radios. NO interface box is required!

Thanks for the info Dave I have asked the guy again to clarify and he just emailed me back to say radio was on the way! I really want the radio so think I'll wait to see if it does actually have the tuner before I get onto eBay, paid approx $550 for the rig.
If you could email me the details for the cable hookup that would be great. Thanks

Paul,
If that radio does not have the ant tuner you got screwed. Go to ebay asap
if it comes there without it. That is fraud!

Dave,

The pictures you sent me show nothing more than a bunch of cables wrapped in tape and even that is hard to make out. Where is the wiring diagram? How are we to investigate this "rip off" when we can't even see the circuit?

I sent Dave a very polite e-mail asking for some pictures of the circuit he used, and what I got was a bunch of photographs showing nothing more than the back of his computer, a couple of screen shots of Ham Radio Deluxe running and a few shots of cables tied together. No circuit drawing, nothing. Not that I really care. I use my own homebrew interface thats works quite well, I was only curious as to what he was using. As a former moderator and co-owner of this group I would expect something to be done about his tone to myself and other members as shown in his responses. I would suggest his status be changed to moderated, as I feel nothing I have asked of him is worthy of his rude, sarcastic responses.

Johnny,

I WAS RUDE???? Look at the replies he has sent other members my friend. You say you were quite shocked at the e-mail I sent him regarding the photos? I never sent him an e-mail after he sent the pictures, I replied publicly in this group. And as for demanding, I demanded nothing. I really wish I had kept the e-mail I sent him, which basically stated..."Hey Dave, I would be interested in seeing the information on the circuit" and nothing more. And when I inquire about the content of the pictures, stating the ones he sent me really didn't show much, he blasts ME and says he doesn't take kindly to those kinds of e-mails? WTF? And YOU talk about the friendship in ham radio.

Did you not see his reply to Clif? Wake up man and get your facts straight or stay out of it. I will not reply any further on this subject.

It is a metric size. IF HD carries them it will be labelled on the bin
as M6.

6167. Care and (audio) feeding of a TS-850SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-07-24 19:11:30 UTC
From: Ken Bessler
Topic: 6167 Message: 6167

My 2nd TS-850SAT is enroute to me. I had one before but sold it. Rest assured
if I ever sell this one, it'll be for parts on eBay after some major fault arises.

Hopefully that won't happen for many years.

Anyways, my new rig has the RTTY jack redirected to the balanced modulator and I'm trying to learn how (or if) to use this capability to get that "killer" TX
audio. I do NOT want to exceed normal bandwidth until notions like eSSB become
approved. I also do not want people finding me on the air just to complain that
I'm "splattering".

I did a bit of googling and learned of an inexpensive alternative to the multiple
stage studio quality audio hardware. That is the software equalizer by RoMac. I
figure if it's good enough for Art Bell then it's worth looking into. I downloaded
the demo and was STUNNED how a simple headset boom mic from a cell phone could be made to sound so good. REALLY good.

Anyone have tips on feeding the balanced modulator? I may be wrong (and please, someone correct me if this is so) but the way I see it my goals and restrictions might be met by feeding the Romac eq with my boom mic then directing the output to my mic socket (through the necessary attenuation and transformers), not the balanced modulator. Right? Wrong?

Also, let me see if I got this right - All mics (even garbage ones) are alike except
for how they respond to input therefore all I need is a "decent" mic and a good TX DSP program like RoMac or a hardware eq to compensate.

Sorry guys if this sounds dumb but I'm learning......

Ken

Howdy Gang!

I had a DRU-2 which i almost never used on my 850.

Tried it before selling, it was OK. Then i sold it to a HAM around here.

He told me he changed the battery, but no improvement.

The unit will start to count seconds during recording, but when he
tries to play back his voice, he doesn't hear anything! Yes, he hooked
up the original MC43 handmike... :)

Any ideas?

Thanx a lot in advance for your help,

Hi all, I have been a member of this group for some time and then dropped out because on other things. I just joined again so I could let the grope know that I am selling my Kenwood gear. This group has been a lot of help to me and I have learned a lot here. I just listed my gear in eHam.net yesterday and thought it fitting that I should advise everyone here of it. I am going to just copy the listings onto here to make it easy for all. If interested please contact me directly at, wenjint@...

I have for sale the Kenwood TS-850S/AT SN21000429 (with built in tuner). It has been updated to the new DDS chips and the stock filters have been replaced with INRAD 2.8 KHz filters in both IF\'s and wired in by Clif, KA5IPF at AVVid. The radio also has INRAD 2.1 KHz filters installed in both IF\'s. The filters alone would cost $540 from INRAD. The CAR board has had the capacitors replaced with upgraded caps as per Kenwoods recommendation. The radio comes with the original owners manual, Kenwood service manual, the Kenwood hand microphone, and both boxes. Cosmetically the radio is about a 9 out of 10. The price is $850 plus shipping from Payson, AZ 85541.

I have for sale the much sought after Kenwood DSP-100 Digital Signal Processor, sn. 30200285. This unit is in excellent condition and works better then new. I have just finished checking it out and fixing a few bad solder connections on the back connectors. I also added two small 40mm fans to the bottom to keep things cool, one on each side. A resistor keeps the fans running at a very slow speed so there is no noise. Also installed taller feet to the bottom to allow air circulation and clearance for the fans. I also just bought a new 6 pin connection cable to replace the original, still in the package. The 13 pin connection cable is in new condition. Also included are the two phone cables (but not original), and the original owners manual. I have taken many photos of the unit including the fan installations and they are available upon request. I am asking $650 plus shipping from Payson, AZ 85541.

Thanks everyone, Al, n7ioh

Thank you Dave, he said he did that, but nothing though.
I will visit him and take back the unit, then i'll have it checked by
a friend of mine who is a tech.

6173. Intermittant TX - TS-850SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-07-27 08:23:17 UTC
From: Ken Bessler
Topic: 6173 Message: 6173

My TS-850SAT sometimes won't have any SSB power and no AM TX.
CW, FSK and FM are fine. VOX works. I pulled the top and bottom
covers off and while the rig was faulting, I moved and jiggled several
cables. Nada.

I gave up and decided to flip her over and followed the instructions
for using the cal cable to trim the frequency (which was about 48hz
off). While I was undoing the screws for the CAR unit - BINGO! The
rig works.

I would like to add that the previous owner modded the rig by un-
plugging the RTTY cable from the jack pc board. He then added a
small electrolytic cap to the jack and fed a sheilded line to the bal-
anced modulator. I dunno if that has anything to do with my issue.

Help?

Ken

ssb is the sidebands of am, so this makes sense

I gave up and decided to flip her over and followed the instructions

anced modulator. I dunno if that has anything to do with my issue.

some tnc input are too loud in audio, so maybe he was trying to limit, or suppress rf...
this would have NO effect on mike operation though

Help?

I'm now using the clubs TS-450 and I really would like to be able to use Ham Radio Deluxe controls as well as the digital modes available. I have researched a little bit but have yet to talk to anyone using this combination. My question is how easy or difficult was the set up process and what else will I need to get to complete all the needed connections? My future plans are to buy an 857D for my own rig so I want to be sure that I will be able to use the RIGblaster with that radio as well. Thank you in advance for all your help!

Setup for the TS-450SAT is very easy. I have 2 of them here. Just go to eBay and search for G4ZLP. He makes an interface cable that plugs into the side of the radio and goes right into the computer. I have bought 3 cables from him and the service is great. Took 6 days from the UK to Oregon. And the price is right!! 73

I just realised my TS-850SAT's power cord is not the factory cord.
Sure, it's long enough and heavy enough but it has both conductors
fused. That's ok, too but I'm confused about the fuse size. Do I use
25A fuses in both holders or smaller ones?

You'll have to use 25A fuses in both, or bypass the ground lead fuse and just use one in the plus voltage lead (recommended). Each lead is going to conduct the same current.

Use a 25 amp fuse in each lead. The stock fuse should
be an AGC 25A fuse, fast blow. Mine say 250 Volt but
32 volt is fine also.

Topic: 6184 Message: 6184

My TS-850SAT has developed a stingy ALC meter. The only time I see
a reading is when the tuner is out of line and the SWR is a touch high
(1.5:1 or so). I suspect a dirty pot but I don't know if I should adjust
that or how to adjust that.

Help?

HI
I have a TS-850SAT with stock filters and opt 500 HZ Kenwood
8 MHZ IF fliter only.

I am thinking of getting a 2.1 or 1.8 for SSB, from INRAD for the 455
IF , anyone have recomendations , I operate mostly SSB, but some CW and
digtal modes some. Maybe would condisider a 500 HZ for the 455 IF too.

I didn't think it would do much good to get a 1.8 for the 8 MHZ IF

Any recomendations ?

the slope tuning is just as effective as a 1.8 mhz filter for SSB; save your money and put it to a cw filter

Hi Ray,

I have the stock SSB filters in both IF's, and a 1.8 SSB filter in the 8 MHz IF and 500 Hz INRAD in the 8 MHz and 455 KHz Collins mechanical filter in the 455 KHz IF. The 1.8 is the least useful I think. My operating habits are similar to yours, though I spend most of my time listening instead of talking.

A second 455 KHz, 400 Hz wide cw filter (cascaded with the 8.83 MHz)
would do
wonders for the rig in that and narrower modes. Otherwise, try the 455
KHz IF,
2.1 KHz filter, as it'll really cut down on adjacent splatter in crowded
conditions and
during SSB contests.

Personally, I run all INRAD filters in my 850SAT -- a 400 Hz in the 8.83
MHz IF,
and two each 2.8 KHz wide filters in both IF's for SSB.

GL.

Let us know what you decide and how you like it.

Steve, NL7W

I run 500 hz CW filters in both IF's. I don't notice a big reduction in noise when engaging the 8.83 filter. The 455 filter works wonders. I don't do much CW but they are a godsend for digital mode work.

6196. Re: TS 850 SAT Serial number 9xxxxxx, date of built?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-09 17:08:49 UTC
From: Clif
Topic: 6191 Message: 6196

Sorry but that doesn't compute.

A quick glance in my records shows 940's with serial numbers starting with 7xxx, 8xxx, 9xxx, 01xx, 00xx. How about the ones starting with 507x, 511x, 512x.

They were made from ~'82-'89.

I didn't look up other models but I'm sure it's the same.

6198. No output power TS-850 with AT switched on! Solution here.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-11 19:28:46 UTC
From: Joe
Topic: 6198 Message: 6198

Today I repaired an Kenwood TS-850, the second one with the same failure, so I would share this information.

Symptom: TS-850S output power is 100W, power consumption ist ~ 20 A, internal pwr meter shows also ~ 100W.

If you switch on the automatic antenna tuner, after tuning, you will see the same result, but if you look atr an external pwr meter, you will see only 1 w output.

The failure is C1/33pf at the antenna tuner, its burned out.
Its near the relais switch K1.
Put in a new one, and everything is like new :-)

Hello Group:

As is a typical for communications cables, anyone know, which cable config to use, for the IF-232C, to go from the PC to the IF-232C. 1) Null Modem, 2)Straight-Through, 3) RS-232.

Just recently bought one, and unfortunately it didn't come with a manual. Note: Tried straight-through, it didn't work.

Hope I don't have that signal that isn't low enough to be detected, as low, problem. I read about, in this group.

Thanks, in advance

Hi Den,

If you're using a standard serial port, use RS232.

You need a straight through cable. In general, a piece of equipment that has a female connector on it is a DCE, data communication device like a modem. A male connector is usually a DTE or data terminal device like a PC or dumb terminal. Unlike interfaces use straight through cables, like devices use cross-over or null modem cables. So if you are connecting a male to a female connector, chances are a straight through cable will work.

I think in this case "straight through" means TTL-to-TTL levels. He wants to convert the TTL from the 850 to RS232 for his computer, so RS232 would be the setting desired. The serial port on computers doesn't work with TTL levels.

Et Al:

EA4KT/DL4EA/Antonio, provided the correct answer. By way of the attached manual, if it doesn't get stripped off. The IF-232C Interface requires a Serial RS-232 Cable. The manual provides schematics, defining pin-outs, for a Serial RS-232 and X-Over (Null Modem Cable). It's an interesting read!! Clears things up.

The local computer shop tried to tell me they (Null & Serial) were the same thing. No wonder (the perpetual confusion)!! The manual makes it perfectly clear, they are NOT. Thank you Antonio!! And all those, who responded.

GREAT GROUP.

Why would the IF-232C purport itself, to be a Radio<>PC interface, if it couldn't handle the signal levels from PC-COM Port<>IF-232C without further adue?

Thanks everyone:

de Den/k0un

Max,

This is turning into a nightmare! What does the IF-232C actually do, then? Is it just a box that creates a conversion between DB-25/F to 6-Pin Din/M, to the radio? If it doesn't do the 232 to TTL conversion (what is it good for)? Is it a pig in a poke?

Overall objective: What I am trying to do, is get Ham Radio Deluxe (HRD) to drive a TS-450s/AT, for a blind person (who is my friend). So, that I can control his radio, remotely, (and his PC). To put it, on any frquency, he'd like via the internet. I'd also like to add and sort frequencies, again, remotely, in his TS-450's memory, without having to go out physically and help him. So, you might say we have the "blind, leading the blind" :) No insult intended. I can handle the PC side, no problem. It's the jumping through hoops, for the PC, to Radio Side.

So, in summary, physically, what I need is the 1.) Remote Control Software (Client and Server Side) 2.) PC 3.)HRD Software, 4.) IF-232C Kenwood Box, 5.) RS-232 PC Physical COM Port/M. 6.) 15ft DB-9/F to DB-25/M Serial Cable. 7.) TTL to RS-232 Converter (to stick serially in-line, with the cable) 8.) More patience than I got!! That about sum it up? Oh, BTW, because of the way his shack is layed out, I can't get the PC closer to the Radio (about 12-15ft). Which I am sure, will pose, another problem. An inline Amp, to beef up the data signals? Perhaps:
http://www.232analyzer.com/TTL-RS232-RS485-Serial-Converters/RS232-TTL-Converter.htm

I imagine, by now, I'm testing you alls patience, too. Sorry.

Den,

It really depends on what you are trying to accomplish. If your
intention is to control the radio from the computer, then neither a
null-modem or straight thru cable will work. You need to purchase (!!)

or build an RS232-TTL converter. This will allow the TTL signals from the radio to communicate with the serial port on your computer. There is a very nice little circuit in the files section of this group. I have built 5 or 6 of them now and they all worked the first time. Costs about $30 in new parts, less if you have a good junk box of parts.

the if 232 is the converter. some radios needed a few chips installed in the radio to make it work, but I believe the 450/850 will work as is. The 440 I think needed a few chips dded, The IF-232 is just much more expensive solutions.

The IF-232C *is* an RS232-to-TTL converter, so you don't need another one. The RS-232 spec says you can run a cable up to at least 50 feet between devices (i.e. the PC and the IF-232C), so you don't need any inline amplification. If the PC doesn't have a serial port, a standard consumer-type USB-to-serial converter will do just fine for radio control.

The local connection is: PC running HRD (or other radio control software), using either a serial port or a USB-to-serial adapter, connected via a straight RS232 cable to the IF-232C, connected in turn to the radio.

The one configuration item you will probably need to watch out for in the radio control software is to set the RTS signal on the serial port to "Always on"; if RTS is off the radio will not talk to the computer, although it will receive commands (i.e. you will have no way of knowing whether the commands you sent were received and acted on). The other configuration settings are 4800, N, 8, 2 (I think - I'm not at home where I could check this out).

73,
Rich VE3KI/4

The one configuration item you will probably need to watch out for in the radio control software is to set the RTS signal on the serial port to "Always on"; if RTS is off the radio will not talk to the computer, although it will receive commands (i.e. you will have no way of knowing whether the commands you sent were received and acted on).

Correct Richard, if you want the program to show the readout, the RTS line must be set to always on. If you are using the PC for PTT keying, then you can set it for PTT. In order for the logging feature in MixW to work I use COM1 for frequency control and set RTS to "always on". I use a homebrew PTT, FSK and CW keying circuit from COM2 and these control the appropriate keying functions.

Den,

You stated in the original post you had a IF232 unit. This IF232 unit does two things, it converts TTL (0 to 5 volts) to EIA/TIA RS-232 which is anywhere from -15v to +15 volts. It also converts the DIN plug to a DB25F connector. All you need is a straight through DB25M to DB9F (no more than 200 feet @ 4800 baud) cable to go between your PC and the IF232 box. Set your software for 4800,n,8,1. If there is a setting in your software for "handshaking", i.e. Xon/Xoff, RTS/CTS, also known as hardware handshaking or none, set it to none. It is no more complicated than that. I own 9, TS850's and have numerous IF232's that I used for years until I went to USB adapters. If this doesn't work, it can only be one of three things, the radio, the IF232 box or the computer, THAT'S IT.

73,

Terry

Subject: Re: [TS-850_450_690] Re: IF-232C? Which Cable Config, from PC to IF-232C Interface Box

Max,

This is turning into a nightmare! What does the IF-232C actually do, then? Is it just a box that creates a conversion between DB-25/F to 6-Pin Din/M, to the radio? If it doesn't do the 232 to TTL conversion (what is it good for)? Is it a pig in a poke?

Overall objective: What I am trying to do, is get Ham Radio Deluxe (HRD) to drive a TS-450s/AT, for a blind person (who is my friend). So, that I can control his radio, remotely, (and his PC). To put it, on any frquency, he'd like via the internet. I'd also like to add and sort frequencies, again, remotely, in his TS-450's memory, without having to go out physically and help him. So, you might say we have the "blind, leading the blind" :) No insult intended. I can handle the PC side, no problem. It's the jumping through hoops, for the PC, to Radio Side.

So, in summary, physically, what I need is the 1.) Remote Control Software (Client and Server Side) 2.) PC 3.)HRD Software, 4.) IF-232C Kenwood Box, 5.) RS-232 PC Physical COM Port/M. 6.) 15ft DB-9/F to DB-25/M Serial Cable. 7.) TTL to RS-232 Converter (to stick serially in-line, with the cable) 8.) More patience than I got!! That about sum it up? Oh, BTW, because of the way

his shack is layed out, I can't get the PC closer to the Radio (about
12-15ft). Which I am sure, will pose, another problem. An inline Amp, to
beef up the data signals? Perhaps: http://www.232analy

Den,

It really depends on what you are trying to accomplish. If your
intention is to control the radio from the computer, then neither a
null-modem or straight thru cable will work. You need to purchase (!!)
or build an RS232-TTL converter. This will allow the TTL signals from
the radio to communicate with the serial port on your computer. There
is a very nice little circuit in the files section of this group. I
have built 5 or 6 of them now and they all worked the first time.
Costs about $30 in new parts, less if you have a good junk box of parts.

6215. DSP2 output level

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-22 14:27:32 UTC
From: Ivan
Topic: 6215 Message: 6215

Hi all

Does any of you know what is the output level at DSP2 rca connector?

I know the frequency is 36.891 kHz but I want to know the voltage value of this signal to experiment with it, it's the 4th IF.

If anyone could meassure with an oscilloscope, press AIP+XIT+SCAN while power on the radio to get output in DSP2, then tune a busy frequency and meassure.

I suspect the value is around 100mVpp but I am not sure.

73 de EA1GHE. TS-450S owner.

Straight into the scope with a patch cord.
No signal 2.4mv P-P
S9 Signal 3.6mv P-P

6223. TS850 CW issue

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-24 20:11:13 UTC
From: Ken Bessler
Topic: 6223 Message: 6223

I have noticed a "tick" at the end of a transmitted CW message. The tick only happens when the 8.83mhz 400hz or 270hz cw filters are in use. I've tried unplugging my mic, my sound card interface and none of that helped.

The tick can be avoided if I use the send/recv button instead of the vox setup but the tick also happens when I switch off the send button.

The only thing I've changed recently (that I haven't disconnected trying to hunt down this glitch) is I added an Inrad #22 270hz 8.83mhz I.F. cw filter yesterday.

One more thing - I can eliminate the tick if I switch the TX bandwidth to a wider filter, say 3kc or 6kc.

Help?

Are you actually transmitting???

You may be listening to a sidetone, but if the VOX is not turned on, your
radio will not go into transmit...

Are you seeing the xmit light coming on, is there a swr/wattmeter in line???

HIM not hearing YOU would be HIS receive having a problem, not yours...

Yes, it does go away after unplugging both 400 and 250hz (8.83 if) filters.
I also noticed
the tick when (in CW mode only) I turn off the send button after turning it
on. No key
action - just tapping the send button on then off. When I do that, the tick
happens
exactly when I switch to recv as opposed to the delay when using vox.

Wierd, eh?

Yes, it does go away after unplugging both 400 and 250hz (8.83 if) filters.
I also noticed
the tick when (in CW mode only) I turn off the send button after turning it
on. No key
action - just tapping the send button on then off. When I do that, the tick
happens
exactly when I switch to recv as opposed to the delay when using vox.

Wierd, eh?

6231. Add DSP Demodulators to your Kenwood for $12!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-26 09:27:09 UTC
From: Rob Frohne
Topic: 6231 Message: 6231

Hi,

Assuming you have a PC with a sound card in your shack already, you can add the DSP demodulators that are used in the FlexRadio's to your Kenwood for around $12. Have a look at http://www.wu2x.com/sdr.html if you are into Windows. I am more inclined to Linux, so I did it this way. http://www.wwc.edu/frohro/SDR/SDR-Shell/ The results are really quite nice. I really like the synchronous AM detector, the automatic notch filter and the spectral display.

73,

Rob, KL7NA

6232. TS-850S/ Dead TX (1-2w out) or...?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-26 12:54:57 UTC
From: Samir Popaja
Topic: 6232 Message: 6232

Hello,
Thank you for reading this.

I have the TS850 which is dead in TX, the power output is about 1-2 watts in all bands and modes, the power supply meter says 7 Ampers at 13.8V volts. No ALC at all. RX is OK.

Has someone experienced the same problem? Any help? Is possible that power amplifiers transistors are dead? How to check? Any idea for begin the troubleshoting.

Thanks
Samir, SM7VZX

Hi Tony,

Actually, the first link is to WU2X's site, and he is using a TS-940 and windows software. I'm the one using Linux software and a TS-850S, but I suspect that any Kenwood rig that is supported in Ham Radio Deluxe will work with his software.

Hi Max,

You might want to consider the possibility of using the 455 KHz IF like
I did. It gives you the 455 KHz filters to use as well if you wish.
The down side is you have to go inside the rig to connect to that IF.
The 8.83 MHz IF has a jack on the back.

73,

Rob, KL7NA

I thought of that Rob, as I have a 500 hz CW filter in the 455 IF. But using the Power SDR software, the IF bandwidth is adjustable so I will try that route first. I saw the mod you did to the 850. I am no stranger to these radios having performed many mods on mine in the past. I'll let you know how the 8.83 IF turns out.

I have for sale a Buxcomm Rascal interface for Kenwood radios using the 13 Pin ACC jack like the TS850/450/690/570 and others. It is in like new condition with the CD containing the different digital mode programs. This is the model that uses a serial port on your computer. It sells new for $55 shipped, I am asking $36 shipped in the US.

From: John AA5JG
Topic: 6245 Message: 6245

I have a few extra items for sale, which will work great with any FT450/690/850 setup. Here is what I have:

1. Radio Shack 20 amp switching PS, with terminals on the back, asking $50

2. Workman 28 amp switching PS, with terminals on the front, low current spring terminals on the back, and a cigarette lighter jack on the front. Asking $65.

3. MFJ 949E antenna tuner in very nice condition. It is about 1 year old, has a built in dummy load, watt meter, SWR meter, and antenna switch. It will switch between 2 coax antennas, 1 single wire or twin lead antenna, and the dummy load. Sells new for $160, I am asking $75.

Prices do not include shipping from zip 73507. I can take paypal/check/cash/mo.

73s John AA5JG

Yes, Max, I'm interested to hear how it works for you. I didn't want to drill holes in my TS-850SAT, and so I have the bottom filter access panel off and wires coming out that.
Having the jack on the back is really a nice advantage in my opinion. I just couldn't find any nice way to do the connect in to the 455 KHz IF using existing jacks. I miss the days when manufacturers put "spare" jacks in their equipment.

Bottom of the 850 right in the middle, between the IF and RF board is
a great spot. I have a 1/4" jack there for my balanced modulator feed.
Could very easily work for an IF tap.

6253. TS-450 Lighting Strike

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-08-30 01:39:43 UTC
From: w4jz
Topic: 6253 Message: 6253

My father-in-law did one of those oh I forgot to disconnect my antenna right after a brief storm went through. Came in on the antenna.. do have 13.8 volts to the rig, but rig will not power on.

I don't have the rig yet, but is there some kind of lighting protection in the little 450? He said there is no smell of anything burned so guessing, more like hoping, not too much shot in rig. But with lighting you never know.

Any suggestions would be appreciated!

Thanks,
Reed W4JZ

I used to have a piece of wire, intended to calibrate my TS850-SAT.
Can anyone remind me how to do it please !

Yes, HRD does everything I want. But, it doesn't work in Windows 98. And the HRD site. Says not to mention Windows 98. It says it "may" work in Windows 98 and if it doesn't, don't ask.

I'd suggest that you not bother with the wire. What I do is tune in WWV at 15 MHz in CW mode (or any other stable, accurate frequency standard for that matter). Toggle back and forth between CW and CW-R. If the TS-850 is right on frequency, there will be no difference in pitch as you switch back and forth. If the TS-850 is off frequency a bit, you adjust frequency trimmer TC-5 to get the audio tone to not shift up and down as you switch between CW and CW-R.

If your radio is connected to a computer for digital mode operation, that can make things even easier. Set your computer up for PSK-31 mode and click on the WWV carrier. You can read the exact audio frequency of the CW and CW-R tones as the PSK-31 decoder tracks your adjustments.

6266. My TS-850SAT repair

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-04 22:28:31 UTC
From: José V. Gavilá
Topic: 6266 Message: 6266

Hello!

I am working since yesterday on a new to me TS-850SAT. I got it cheap as it had been looked at by a couple respected technicians and both had said it was not worth fixing...

Well, I am fond to that kind of challenges and, so far, most of the times rigs go back from their untimely death :-)

Luckily, this time I am also in the right path: yesterday I received a rig which just transmitted on SSB and didn't receive anything. After some study of Service Manual and schematics I hooked the oscilloscope and found that RXB control signal was a sawtooth-like signal when in RX, instead of the 8VDC it should be... I found a couple of suspect digital transistors in TRX module and, once replaced, RX was OK in all modes and bands :-)!. So far, so good...

Today, checking the rig in a bit more detail, I have found some other faults, which I list below:

(1)TXB signal is 8VDC on TX (OK) but 0.9V on RX. It seems doesn't affect operation but I think something should be wrong. Any hint?

(2)S-meter does not work except in FM mode (so I know A/D converter in uP is fine). If you lower RF GAIN, S-meter deflects. But with on-air or signal generator signals, S-meter just doesn't move. RX sensitivity is perfectly fine. And AGC works also fine in all modes. I think that module SM-AMP in IF unit is the prime suspect. And, on it, NJM2904A amplifier could be the cause of the problem, as AGC level is OK but S-meter output is low. I have tried the S-meter alignment procedure but does nothing. Any hint on this?. Has someone an spare NJM2904A around?

(3)Antenna Tuner only works in 80 meters... it seems to me it should have an stuck relay.

Well, so far these are all the faults found. All in all, I have already a mostly working rig and, being a 'parts unit' it is not a bad start :-)

Regards,

JOSE - EB5AGV

Topic: 6253 Message: 6267

Another method that works well (tnx to K6LL):

There are a lot of TS-850's out there. Here's a quick
procedure for checking and aligning frequency
calibration. This general approach behind this
procedure should apply to almost any radio.
Calibration is especially important if you are
using packet/telnet.

TS-850 Quick Dial Calibration Check

1. Tune the radio to 10Mhz, so you can hear WWV.

2. Press the "tune" button on the radio (keypad #7).

3. Set vfo A to 10000.10 KhZ.

4. Set vfo B to 9999.90 Khz.

5. Flip back and forth between vfo A and B. On both, you should
hear a low tone of about 100Hz, just off zero beat of the
WWV carrier. If the tones are not exactly equal in frequency,
adjust TC-5 on the PLL Unit, as follows:

TS-850 Quick Dial Calibration

6. Remove the TS-850 top cover.

7. There is a three-stack of boards on the left side
of the radio. On the left side of the lowest shield,
there is an elliptical cutout. Peek inside, and you
will see the screwdriver-adjustable pot TC-5.

8. Make a small adjustments to TC-5, and repeat step 5
above until the two tones are exactly equal in frequency.

Interesting question...

Having never owned or operated an FL-2100 series amp, my question would be, "Can you overdrive an FL-2100 series amp with 100 watts?" I noted the 2100Z's ALC only activates when the plate current exceeds half an amp (0.5 A), and that the amp requires a 100-watt transmitter for full output from the FL-2100(Z).

Any 2100 series experts out there?

73.

Sure, this scheme works on the newer radios with a single reference oscillator. For Kenwood, that was at least as far back as the TS-140. Essentially you are looking for a pitch change when you listen to a frequency standard signal as us switch between upper and lower sideband or CW and CW-R.

A simple way to check your frequency accuracy if you are not able to do the CW - CWR toggling is to tune your transceiver to read exactly 10.000.00 MHz or 15.000.00 MHz and switch between USB and LSB while the 400 or 600 Hz tone is being transmitted by WWV. If the transceiver's reference oscillator is off frequency, the tone will be different as you toggle back and forth between USB and LSB.

To figure out exactly how far off frequency your radio is, you tune the radio up or down while toggling the mode until you find a spot that produces no tone shift. The frequency readout will tell you how far off you are. At 15 MHz, 15 Hz is 1 PPM (Part Per Million) error.

Your frequency error will be proportional to frequency. Off high by 50 Hz at 10 Mz means that you will be off high by 5 Hz at 1MHz and 100 Hz high at 20 MHz.

Hello!

>Has anybody made up a kit for replacing the capacitors on ts-850.?????

Mmmmm.... so I suspect the full leaking set (11 capacitors!) in the PLL UNIT of the 850 I got yesterday for repair is not an isolate case :-(!

Curiously enough, I bought a 'parts unit' 850 last week (and I had never owned one before). And just yesterday I got one in the shop for repair... In my unit, only leaking capacitor I could find was the larger one at the PLL unit. But in the other 850, there were, so far, 13 leaking caps!. One in the display circuit (which made the display blank), another in the audio output circuit (which prevented any audio output from the rig) and today I have found that all 11 caps in the PLL UNIT were leaking badly.

Are there any more suspect capacitors to look after?

I am really curious about this... is it just a matter of the 850 or is it common for other rigs of those years?. I have repaired some dozens of different brands rigs and had never found such a bad case as in last 850!

Regards,

JOSE (who is checking Farnell catalog to buy some caps ;-))

The carrier board SMD caps that tend to leak can be replaced with these
from Mouser:

1 x 647-UUD1E470MCL - 47uf, 25v
10 x 647-UUD1E220MCL - 22uf, 25v (Mouser didn't have 10uf in stock
when I bought them)

I have pictures of the job at http://www.zievid.com/W6OT/TS-850/TS-850.htm.

Hope this helps,
- Dave

Dave:
I have a list somewhere but finding it in the workshop will be
something hi hi.. Rich N8UX has repaired a number of 850's as has a
couple of others on here. i copied your message to rich . i am sure
one of the other 850 repair guys will have a list . what i did was
just go there the parts list in the book and looked for 16 v caps.

6282. Need trimmer cap for PLL board?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-11 22:59:32 UTC
From: Bill Maddock
Topic: 6282 Message: 6282

Last week my TS-850S got the symptoms of rasy audio - it was on all bands. I went out to the TS-850S page and located the write up on adjusting TC1 to get 5.0 volts on TP1. So far it is working ok now, but my second radio has the same problem now and I have adjusted this trimmer cap before - it worked for a while. I would like to replace the caps for a permanent fix - the kenwood part # is C05-0331-05 it's a 10pf trimmer cap. Anyone have any idea where I can obtain several of them so I can get a permanent fix?? What has everyone else been doing to fix this? Any suggestions would be much appreciated! Thanks for the help and 73!

From: nz7c
Topic: 6285 Message: 6285

I'm pretty "attached" to the TS-850's and would like mine to keep operating for a long time. However I am not an electronics person. I would like to do just an "eyeball" inspection of my rig. I undertand that caps can "go bad" etc. I won't pretend that I know what makes a cap go bad but I would like to know if that or anything else can be observed by a visual inspection. Could one of you who are expereienced in electronics tell me what, if anything, I should look for when I pop the cabinet and inspect a rig? Other than checking the battery - are there tell-tale signs of any other form of component degradation I should look for? Thanks in advance folks.

Hi All,

can I just clarify, that if I adjust the sidetone pitch on my TS450, using menu 40, down to 650hz (which is more comfortable for my ears), that I wont be 150Hz off freq when I call someone??

I realise that I won't be able to use the 800hz tone to zero beat.

i'm just a little confused as this is the first radio I've had where the TX sidetone is fixed, so to speak!!

thanks

David, VK2NU

You can get all kinds of answers and arguments about that question.
The store where I did work for found this.

The MC60 was wired for the older radios and had a 4 pin plug. The
MC60A was wired for the later radios and had an 8 pin plug. That was
the only difference we could find. You could order from Kenwood the
cable from the mike to the radio with either plug. The mike end was an
8 pin for both cables.

Oh the 4 pin had to have batteries for the preamp. The 8 pin got power
from the radio and didn't need batteries although the holder was there.

The only reason I'd bother is to upgrade the components to avoid
future problems. However, as long as the part is that cheap and is
easy to get......

Part ordered $16.81 including shipping.

Thanks, Clif!

6301. Looking for TS850/TS690

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-17 05:32:50 UTC
From: John Geiger
Topic: 6301 Message: 6301

I am looking for a Kenwood TS850SAT or TS690SAT HF rigs. I would like one with the autotuner installed, and at least a hand mic and power cord with it. I have 2 different rigs that can be worked into a trade for one of these Kenwoods. Here is what I have:

1. Yaesu FT920 HF/6m rig with DSP, built in autotuner, CW memory keyer, and voice keyer. Works fine, but the case has a couple of rough spots on it. It has the mic, power cord, and manual.

2. Yaesu FT100D HF/6m/2m/70cm radio in excellent condition. It has DSP, a built in CW memory keyer, and does 100 watts on HF and 6m, 50 watts on 2m, and 20 watts on 70cm. Comes with mic, power cord, manual, and original box.

I would also entertain cash offers for either rig. In person trades in the OKC, Dallas, Tulsa area would be nice, but I would ship either rig also. These rigs both work great, but I just prefer the way Kenwood rigs are set up instead.

Anyone have a 850 or 690 they are interested in trading?

Hey John! I have a TS-690SAT in great shape that I would be willing to part with! I'm interested in the mobile 100D. I want something in the Jeep and that would be a good one! Mine is in great shape with the mike, power cord, etc.

Let me know if you're interested...

6306. ALC adjustment on the 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-21 14:14:43 UTC
From: kdrosenlund
Topic: 6306 Message: 6306

I was trying to adjust the ALC per the service manual, which says
to turn VR8 (SWR protect) to minimum before adjusting VR7, the ALC trimmer.

Well, there is no 'minimum' stop on my VR8, it just keeps going around.
How do I know what is minimum?

I know VR7 is not set right, I have to turn my
PWR control way down for 100W, but it works otherwise.

Thanks for any help,

Kit KG6PHS

Kit,

I would assume you are adjusting everything into a dummy load. VR8
controls the power fold back should the rig be transmitting into a
high SWR. I guess to find minimum, key the transmitter into a 3:1 SWR
according to the rigs SWR meter and adjust VR8 for maximum power
output. Do this quickly. Then go back and readjust VR7 for 100W on
the meter into a dummy load. Anything higher than that is unnecessary
and the station on the other end won't notice the difference anyway.
Make sure the carrier and power controls on the rig are both at maximum.

Max

ts850 to if232c is same cable as a commodore 64 floppy drive 6 pin din (LARGE)

IF232C TO PC, is a standard 25 pin serial cable to whatever (25 or 9) connection you have., if you have one

wiring for those should be on most computer websites.

Go to the final unit. There are 4 supply voltages that come from it. Locate CN2 (8 pin connector) and measure the voltages on it. Pins 1,2,3 should be 14v, Pin 4 8v, Pin 5 5v, Pin 6 8v, Pin 7,8 are Gnd.

The 2 8v lines are from different regulators so they must both be there. See if any of those are dropping. If so there is probably something on the line pulling the regulator down, very seldom do the regulators go out. Also the 3 regulators are thermally protected. If they are not attached to the heatsink they will overheat and turn off.

6319. TS-850S ACC1 DIN plug and interface

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-25 23:51:19 UTC
From: kdrosenlund
Topic: 6319 Message: 6319

I was trying to find a DIN plug for the computer interface
using the ACC1 jack on my 850.

Are these standard DIN pin layouts? I could use one.
I found a DB-9 cable
to solder to it.

Has anyone tried the simple computer interface with
just a zener diode and a resistor that's found on the net?

Thanks,
Kit

the interface cable is a 6 pin din, same cable as a floppy drive for a commodore 64

this goes into the if-232c.

Thanks for the reply. I need to order a new one from Universal Radio
or somebody else though. All Mac here, no Commodore! I emailed them about it and they
said that Kenwood uses a different pin spacing than normal, but they sent me the part
number for an 8-pin plug. Go figure.

I think the 8 pin may work if you remove some of the
pins...it is a 6 pin din. Got mine from mouser. I use
the 232 level converter on the Ham Radio Deluxe page.
Uses 3 resistors , 3 diodes, and a dual optocoupler.
Works on mine....73....Tom N8NMA

I have a Mint TS-690SAT with the antenna tuner and 3 Filters installed.
The Filters are the YK-88SN-1, The YK- 88C-1, and the YG455C-1.
The transceiver is in beautiful condition.
I thought I would post here before I put it up on ebay.
I am asking $900.00 plus shipping.
Please contact me at caludaj@... if interested.
Thanks
Joe AA5HP

PLEASE,,,,, PLEASE

If you order the plug from someone other than Kenwood before wiring it up see if it plugs in. It should go in very easily. One little pinkie worth of pressure, max. I have had to replace several sockets that were broken from the owners forcing in the wrong size plug, "But it had 8(or 6) pins"

Some of those sockets are "No Longer Available"

Hi, the inteface with the zenner diode and
resistor works on my Laptop connected to
COM1. Works with N1MM and HamRadioDeluxe
v3.5 build 1510 (WIN 98SE) quite some time now.
Also made few of this interfaces and all of
them works on Knwd-850 and 950, not sure
(not tested) on others.

Just to be sure, I'm talking about K6LL
version of the interface found on www.mods.dk.

I have a spare if you need it. I built my interface on a small board
and mounted it inside my 850.

Thanks everyone for your help. Sure Max, I'll take your spare, sounds easier
than cutting a pin off one.

I can't wait to get computer control on my Kenwood,
it'll be easy to manage all those channels for one thing!
Your idea sounds good, maybe I should put my simple interface inside.

How much do you want me to send (green stamps?) for your spare plug?

Thanks,
Kit

Cliff
checked the voltages as u suggested they r all ok,decided to unplug the board below the speaker and immediatley the display came up so i assume the problem is on that board,i am hoping a friend with more electronic know how can figure out what is the problem with the board and if it can be repaiired.

Subject: [TS-850_450_690] Re: TS690

Go to the final unit. There are 4 supply voltages that come from it.
Locate CN2 (8 pin connector) and measure the voltages on it. Pins
1,2,3 should be 14v, Pin 4 8v, Pin 5 5v, Pin 6 8v, Pin 7,8 are Gnd.

The 2 8v lines are from different regulators so they must both be
there. See if any of those are dropping. If so there is probably
something on the line pulling the regulator down, very seldom do the
regulators go out. Also the 3 regulators are thermally protected. If
they are not attached to the heatsink they will overheat and turn off.

6331. TS-690 Filter Questions

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-27 10:28:31 UTC
From: spstrock
Topic: 6331 Message: 6331

Greetings to all.....

I just upgraded from a TS-440 to a TS-690. The filter choices in the TS-440 were very straight forward and I had installed the narrow SSB and narrow CW. Now with the TS-690, that came with no filters installed, there is an additional slot for a 445CW filter. This is new to me and I am not sure if I understand it completely and the manual is not very clear. Do I install a CW in either the 8.83 slot OR the 455 - or both? What, if any, benefit is there to the 455 slot? I see the filter pricing from Inrad is significantly higher for the 455. Should I install two different width filters, 1 in the 8.83 and 1 in the 455??

A simple explanation/recommendation would be greatly appreciated.

Thank You in advance

Stephen / WA2FDU

6335. Re: TS-690 Filter Questions

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-09-28 03:04:03 UTC
From: Richard Ferch
Topic: 6331 Message: 6335

The 455 kHz filter is more expensive because they are more expensive to manufacture. However, in my view the extra expense is worth it for the better shape factor (steeper filter skirts). On the other hand, the 8.83 MHz is earlier in the amplification chain and thus it is better at cutting down on AGC pumping from very strong nearby signals. The combination of both works better in crowded (e.g. contest) conditions than either one on its own.

With both installed, I find two different combinations useful:

8.83 MHz only when I want "soft" skirts to hear what's going on nearby (e.g. when CQing); or

8.83 MHz and 455 kHz when I want better rejection (e.g. when trying to work a weak signal through QRM).

73,
Rich VE3KI

How about after the power switch? I've just recently seen a bad switch
that just would not pass enough current to keep the radio going in RX.

6339. RIGblaster Pro and TS-450S CW issue!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-10-02 23:52:39 UTC

Topic: 6339 Message: 6339

Just hooked up my RIGblaster Pro to a TS-450S the only problem I have run into so far was when TX SSTV using MMSTV there seems to be a CW carrier also being TX. I unplugged the CW patch cable and it stopped. When I'm TX SSTV both the PTT and CW led both light up. What the, is going on? It seems the computer is trying to key the CW as well.

check your dtr/rts settings....mmsstv may need rts, but dtr is used for cw line (thats how they separate the 2 in one unit.... try turning one off until you find which stops the cw

6342. DIN plug pins

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-10-05 01:47:51 UTC
From: kdrosenlund
Topic: 6342 Message: 6342

Hi everyone,

To get my new Kenwood 850 hooked to my computer,
I tried the simple computer interface (zener diode+resistor) and spliced a DB9
cable to the Kenwood ACC1 DIN plug that Max so graciously provided.

The DB9 connector goes to a USB adapter with the Prolific chipset.
That goes to my Mac G4 running MacloggerDX.

There is no communication at all. Let me see if the pins on the
ACC1 plug are right. When you look at the pin (plug-in) end of the
connector, pin 1 is in the one o'clock position, and 2 is right below it.

Right?

-Kit KG6PHS

Hi Kit,

Glad to hear the connector arrived. Looking at the back of the 850, pin 1 is in the lower left (7 o'clock position) From left to right it is pin 1, pin 2, pin 3 is top center, pin 4, pin 5, at 5 o'clock and pin 6 in the middle, not used. I have the IF232 manual if you want me to e-mail it to you.

Max

Hi!
I use such interface, I suggest you to try with the
Ham Radio Deluxe, in the radio setup must be:

Company: Kenwood
Radio: TS-850
COM Port: COM1
Speed: 4800

CTS (Not checked)
RTS (checked)

Press Connect (radio must be on).

Also try with N1MM Logger:
In main window, config, configure ports:
Port: Kenwood, (press set):
Speed 4800, Parity N, Databits 8, Stop bits 2
DTR (pin4) Always on
RTS (pin7) Always on
Press OK.

I'm sure that those CTS and RTS are set wrong,
and if they are then the radio will not respond.

I hope this helps.

Hi Max,

I think I'm more confused. Looking at the jack on the back of the 850, the notch is at the top. Isn't pin one next to the notch? Wouldn't pin one be either one o'clock or eleven o'clock?

Thanks, Kit

Hi Kit,

Sorry, I see now the pinout in the IF232 book is upside down. Looking
at the back of the radio, pin one is in the top right. Pin 2 below,
pin 3 bottom middle, then pin 5 and pin 5 in the top left.

!!!!

Max

I have a TS450S-AT . I have not been into CW since my novice days back in 78 so when I bought it new I did not get the extra CW filters. Now I have on order a SignaLink USB interface for PSK31 use and want to get into PSK31. My question is, for PSK31 would a filter be helpful and which one?

Yes, a filter would be very helpful. I'd recommend the INRAD
(ICE) filters -

http://www.qth.com/inrad/TS-450S.HTM

Either the 400 Hz or 250 Hz filters should be fine. You should have two
filters - one for the 8830 kHz IF and one for the 455 kHz IF, both at the
same bandwidth (whatever you choose). They're worth the money!

For digital work a narrow filter is a definite must. I use 500 hz filters in both IF's in my 850 and the difference is like night and day. If you can put a second sound card in your computer there is another way that gives you more flexibility. The downside is at this level you are working with audio filtering, not IF filtering, so strong signals will hamper the softwares ability to read the signal.

I find the tighter the filter, the less signals I see across the 3 khz spectrum., I keep my filters to 2.1 and narrow up from there only after I make contact on psk

I myself think the cw is too tight, but slope tuing on the 850 does a very nice job for me

HI Rich

I have a '450SAT here and like it. If you are going to run PSK31, you will probably be running AFSK. Then you have to run it in the SSB postition. Probably 1.8kc would be the least you would be able to have and still be able to run SSB.

Most of the PSK operation is done with the filters pretty much open anyway as you can see a couple hundred kc's in the waterfall and just click on the signals anyway. 73

The TS-850 lets you use CW (500 Hz or narrower) filters in SSB mode.
Doesn't the '450?

I use my SSB filters to see what is on the band while just tuning
around, but to make QSOs with anyone other than the strongest signals
on the band, I use narrow filters. A macro button in the digital mode
software can be used to retune the radio so the desired signal is in
the center of the narrow filter's bandpass.

the ts2000 and 690 and 440 and 570 are all using the mb430, BUT they have different brackets that mount to the radio. so as long as you have the complete kit, should be no problem...

check your specs... I also have an original style mb-430 kit...

Well....OK. If you change your mind or anybody else needs the bracket
kit (smb-430 with box) I have one for a ts-2000 I no longer have and
just want to get it to somebody that needs one. $22 incl. shipping.

HI Rich

Well, you are right. I was thinking of my old Yaesu FT 840 here. You can only use the narrow filter on CW. You can use the filters on hte '450 in any mode except FM. I have never tried using them in the SSB mode. 73

6369. 160 Mtr Antenna help

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-10-13 06:04:27 UTC
From: Paul Spiteri
Topic: 6369 Message: 6369

Hi everyone,
I am looking for some help regarding a dipole for 160 Mtr band. I made up a dipole of 127 feet on each side (254 feet long) tuned on 1.850 with swr of 1:1. It is like 40 feet up the roof handled with the antenna mast. I noticed that I have big statics like S9 anytime. Can someone told me how can I reduce this statics because it's very difficult to copy a station through it. I appriciate any help.

as opposed to finding where the static is coming from (is it in the house??, etc) try also changing your angle of radiation, by lower the pitch of the antenna, (try 30 feet), also changing the pattern , rotate the dipole a bit

From: Bill Maddock
Topic: 6369 Message: 6371

Paul,
You could have power line noise, but I would guess it is just atmospherics common to the 160 mtr band. It will be much quiter during the day when the band is not opened up. I typically have an s9 noise level on 160 with my TS-850S at night, I usually turn the preamp off and will sometimes add attenuation with the 6 and 12 db attenuators. You cannot hear below the noise anyway. 160 mtr band is real bad for static if there are thunderstorms within 500 miles of your qth also. Hope this helps! 160 mtr is much like the AM broadcast band here in the US.

73,

From: Zack Widup
Topic: 6372 Message: 6372

There's a really nice article by VE1FA on the ARRL website called "The Kenwood TS-850SAT HF Transceiver - 13 Years Later".

I didn't know about some of the extra function buttons he mentions. Those are fun to play with!

The article reminded me of the first time I ever used an 850. It had been purchased by the Synton Amateur Radio Club W9YH at the University of Illinois. I fell in love with it immediately.

I've used many different and more modern rigs since then but the 850 is still my favorite and the main rig in my shack. I don't think anything beats the receiver.

73, Zack W9SZ

6380. How to Read S-Meter

Date: 2007-10-19 19:15:49 UTC
From: kjtwlf
Topic: 6380 Message: 6380

Would someone mind explaining to me how to read the (receive) signal strength on my TS-450? There is an upper indicator labeled S (which seems to be related to the position of the RF knob), and a dB scale at the bottom of the display. I'm not sure exactly what they mean and how to use them to determine received signal strength.

Thanks,
-ken

From: ve3wej gmail
Topic: 6380 Message: 6381

0 to 9 on the scale is s (signal strenth), numbers above it are usually refered to as db over s9...

if someone is s9 signal they are doing well enough to give a 59 signal report, some people also add the db over s9 (to impress) to show the other operator he is doing really

trying to keep it NON technical here

Hi,

Has anyone used the Kenwood Interface with the Opto-isolators from the ARRL handbook? I wired up the circuit and cables, checked all the cabling but all I can get is some beeps from the radio and it never connects. I am using Ham Radio Deluxe for the rig control. Does something need to be set on the radio?

Any help / suggestions would be appreciated!

Hi everybody
Yesterday I decided to change my memory battery, my TS-850 is 11 years old and has no troubles.
I looked at
http://n6tr.jzap.com/850BAT.html

The numbering of cables is a good hint, one hint from me:
Cables, which are connected to the backside of the TRX disconnect them there :-)
After this procedure disassemble the front panel board (6 screws) and disolder the battery.
I solder a new one for print mounting and do the revers procedure.
Working time 15 minutes
I tested the old battery no faults after 11 years.

Hallo Rich (and others)

I tested the interface using a termnal program telix and/or minicom.
just enter " I; "
(character I followed bij ;)
and adjust the term program right speed etc 4800 bd 8 bit no par.

the TS850 will answer .

I have used a similar interface, although using a 7405 instead of the opto-isolators.

You will need to set the software to hold RTS "Always On", as well as getting the rest of the settings (4800, n, 8, 2) correct.

6391. Upgrade my TS-450 for a TS-850 ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-10-30 01:07:04 UTC
From: ve9xyz
Topic: 6391 Message: 6391

I've had my trusty TS-450SAT and just heard today about a TS-850 from a chap at work whose father owned one before his death several years ago. I've always thought of the TS-850 as the big brother to my rig, but to be honest I really don't know what the improvements over the TS-450 really are.

So here's the questions:

1. Presuming that this rig is in excellent shape (he says it is, is still in box, etc) - what do I watch out for?

2. What are some of the TS-850 benefits over my TS-450?

I'll do some research on the web, but I felt that this group would have a pretty good perspective on the contrast of these 2 fine rigs.

Thanks,

Kevin

Topic: 6391 Message: 6392

I have both radios. The TS-850S has better selectivity. If you aren't a big contester or don't operate in crowded bands, i.e., 20 meter phone, you probably won't notice the difference. The TS-850S has slope tuning which the 450S does not. 850 has a keyer, 450 nix. Both can have tuners.

I would absolutely plan on a full compliment of filters in either one. I have the 500 Hz filters in both IFs of the 850 and a 270 Hz filter.

In the 450, I have the two 500 Hz filters and the narrow 1.8 SSB filter. That is really the best combination in my opinion.

I have never tried the INRAD 400 Hz filters but I understand they are much better than the Kenwood filters.

I have 450, 850 and 870. I love Kenwoods. I am a DXer and could do what I need to do with any of the three rigs providing the filters are installed. I think you would have a blast with both of them, switching between them, etc. Good to have a back-up too so you stay on the air when the other one goes to Clif at Avvid.

Steve, N4JQQ

PS, also have the TS-690S. Great radio on six too.

I like Steve's comments, but I'll add one additional.

I haven't looked the the ARRL lab test comparisons yet, but I figure the blocking dynamic range and 3rd order intercept point is quite a bit better on the 850S. My 850Sat just won't overload in any contest situation. My lesser Icom rig doesn't even hold a candle to the 850's crunch-proof receiver. If you don't operate contests, or operate on bands with LARGE signals, don't invest in the superior receiver. But, if you do, i.e. have large antennas (yagis, quads, and large wires with gain), invest in a 850S-like receiver. You'll never regret it!

I built the one with the Opto-isolators...not sure if
it is the same as the handbook or not but it works but
only if the 850 is in VFO mode not in memory mode.

I've used my 850 on a 6-station Field Day and it is one of the best crunch-proof performers on FD every year. Other rigs have folded up under the nearby interference. The 850's receiver has to be one of the best.

I have never used a 450 but I own a 440. I don't know what the similarities and differences are, but some of the things the 850 has that the 440 doesn't are four levels of AGC (including "off"), AIP (which is really just a receive preamp), quick memories, dual IF slope tuning, noise blanker level control, built-in keyer, three keyer memories, two switchable attenuators, plus a few things I rarely use.

The quick memories are very useful in contesting.

I'm not sure if the TS440 has manually-adjustable antenna tuner controls through one menu item like the 850 has because my 440 doesn't have the tuner. But sometimes I use that feature on the 850 too.

While I agree with most of your statement you need to look closer at
the AIP circuit. It is not a preamp. The AIP reduces the gain of the
IF strip to help prevent overload from strong stations.

Yes, you're right. At any rate, the 440 doesn't have such a feature. I don't think the 450 does, either. They do have a single attenuator.

Also, with the 850, it's handy to have the switches that allow you to transmit on "B" while listening on "A", transmit on "A" while listening on "B", or the same with memory frequencies. I don't think the 440 or 450 has that either.

I just recently joined the Yahoo Group. I first heard about Clif Holland, KA5IPF, of AVVid, on the City of Tempe Listserver. Some of you already know Clif's excellent reputation for Kenwood repair. I want to (belatedly, by about two weeks) let all know that I recently heeded previously circulated suggestions on that listserver that Clif is the guy to go to if you have a problem with your Kenwood gear.

Beginning with my initial e-mail contact with Clif, I received unexpected *rapid* responses to my inquiries, quick turnaround on the repairs, explanations of what was replaced, return of the defective components and a fairness in component and service-time costs that I thought had disappeared with the honesty of Abe Lincoln.

Thanks again, Clif.

Thanks Clif. That is what I thought too. There was a very good review
of both the TS-450/690 and 850 in QST. If you are a member, log on
their site and read them. At the time, they called the TS-850S the best
CW rig ever manufactured.

As for me, I'm not buying ANYTHING that Clif can't work on.

These are both nice radios.

In 1995 shortly after I was first licensed, I was contemplating the purchase of my first HF radio. My choice came down to the Kenwood TS-450S/AT or the Kenwood TS-850S/AT. It was a difficult decision especially since I did not have anyone to give me advice or tell me what to look for. For a few extra dollars, I selected the TS-850S/AT and have not regretted it once.

The 850 has a much superior receiver and the slope tune really helps reduce or remove adjacent signals on crowded bands. In my early years, I mostly operated SSB and not much CW. I found the optional Kenwood 1.8 Khz filter to be a nice feature to add. I also added 500 hz filters for CW work in both the 833 and 455 IF stages. By putting both 500 filters in line, I can cascade them and get about 400 hz out of them. It is just a bit narrower than a single 500. Combine the cascaded 500s and slope tune and add in the notch filter and you can just about wipe out anything that bothers you. However, you could also wipe out a weak signal if you are not careful.

I have done no mods or had any work done to my 850 and it is going strong. No leakage from the caps or battery (knock on wood). The noise blanker needs work if you are in an area with lots of pulse type noise and there is an easy mod to improve the blanker's performance. After 12 years there is not a scratch on it. I only wish I had purchased the accessories to go along with it back in 1995.

I opted not to get a DSP-100 for my 850, but instead am using a SCAF-1 filter and it is amazing what it will do for your copy of CW and SSB. I have an MFJ-784B tunable DSP filter I sometimes use for digital work. I have run RTTY using an MFJ-1278B TNC and an optoisolator to interface with the 850.

If you are a CW operator, the semi-QSK is nice, but the full QSK is much better (it does take some getting used to hearing between characters and character elements). I use a foot switch to put my AL-811H amp into transmit when driving it with my 850 as the AL-811H does not do QSK or fast semi-QSK (the relay is too slow). Driving a non-QSK amp with the 850 in semi or full mode will eventually damage the finals in the 850.

The auto tuner is outstanding. What more can I say. I've tuned verticals, dipoles, beams, and mobile antennas with it.

My 850 has spent about 95% of its life in my shack, but I have taken it into the field for Field Day and on RV trips. It performs equally well in the field as in the shack.

I've operate several 450s over the years, and I can tell you now, I am glad I picked the Kenwood TS-850S/AT.

If you have a choice, which it sounds like you do, pick the TS-850S/AT. You will not be disappointed. If you can afford to get both, by all means do so, but the 850 will get the most use.

Subject: [TS-850_450_690] Upgrade my TS-450 for a TS-850 ?

I've had my trusty TS-450SAT and just heard today about a TS-850 from a chap at work whose father owned one before his death several years ago. I've always thought of the TS-850 as the big brother to my rig, but to be honest I really don't know what the improvements over the TS-450 really are.

So here's the questions:

1. Presuming that this rig is in excellent shape (he says it is, is still in box, etc) - what do I watch out for?

2. What are some of the TS-850 benefits over my TS-450?

I'll do some research on the web, but I felt that this group would have a pretty good perspective on the contrast of these 2 fine rigs.

Thanks,

Kevin

6403. 100 watts in AM on 850 is this normal ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-10-31 04:16:03 UTC
From: Thomas Jones
Topic: 6403 Message: 6403

I just bought this 850 about a month ago and was just going through all the modes and noticed that it transmits at 100 watts on AM (checked it with the bird) and the manual says 40 watts. Is this normal ? Is this an adjustment done by the operator with the carrier control to bring it down to 40 watts or has someone changed it internally ? Or is something going bad inside the radio ? Any help would be great.

Thanks

Tom N8NMA

Hey Tom,

For a proper and clean signal on AM only, do this in-order, until you get the hang of AM ops:

1. Select the AM mode.
2. Turn down the mic gain to zero (fully counterclock)
3. Adjust the RF Power output control for maximum (fully clockwise).
4. Into a dummy load, key the mic for 100 watts output.
5. Reduce the 100 watts RF output with the Carrier Control (labeled "CAR" on the rig) to 25 watts.
6. Select the ALC range on the multimeter, if not already there -- when transmitting.
7. Begin to increase the MIC gain while speaking normally into the microphone, stop the MIC gain advance when the ALC peaks mid scale -- within the "red bar" ALC range.

That's it. With 25 watts carrier power, and the RF power set for 100 watts peak power, as well as the mic gain properly setup, you now have a 25-watt, low-level modulated, transmitter capable of 100% modulation -- which can peak to 100 watts. With this setup, you should see positive peaking RF power on the rig's meter, as well as external watt meter, when modulating with a voice.

Thanks for the Steve but I was wondering if all
TS850's do the full 100 watts or has someone done
something to change this ? The manual says 40 watts
max ???

Thanks...Tom N8NMA

Does the procedure Steve describes apply to my TS-450 as well? The manual says to adjust for S9 on meter etc but it always seemed strange to me. I never have trouble getting a generous level but wasn't ever sure how the thing sounded on the other end.

Kevin

Topic: 6403 Message: 6407

Hi Again Tom,

Yes, they will. But, they are not designed to operate AM at 100 watts with any modulation to speak of... and remain within the 100 to 120 watt max linear portion of the final amplifier's curve.

That being said, a 25-watt carrier, when modulated to 100%, has a Peak Envelope Power (PEP) power four times the carrier power, or 100 watts -- within the final amp's linear curve. 40-watts, at 100% has a PEP of 160 watts -- slightly above the linear curve -- pushing the curve to its limits. At 40-watts carrier, the ALC circuit should suppress or limit the modulation to something less than 100% -- to keep it somewhat linear and distortion free. But remember, the ALC circuit is a reactionary one. It reacts to an overdrive condition that's has already happened -- distortion that is momentary, but there nonetheless.

I run my 850S at 20 to 25-watts carrier, using the method I've described, and can then drive my Alpha amp to around 250 to 300 watts carrier, and know my linear also remains clean (within its capabilities) and well within the legal limit -- which is 375 watts carrier when modulated to 100%, or 1500-watts PEP.

73.

Most solid state transmitters, when used in the AM mode are "Down
modulated",

In classical plate modulated transmitters, the carrier (say 100 watts),
goes from 0 watts to 200 watts when a audio signal is put on the carrier
at 100% modulation, with the average being 100 watts.

With down modulated AM, the carrier is 100 watts with no audio. When
audio is put on the carrier, the "mean" power drops to ~50 watts (@ 100%
modulation), so the peak of the modulated signal does not exceed 100
watts... as a safety factor, the average "mean" power is set to ~40 watts.

The amount of "down" is driven by the ALC circuit, so the peak does not
exceed 100 watts, to protect the finals. At 50% modulation, the peak
will still be 100 watts, and the mean output will be approximately 75
watts, and the low will be 50 watts.

In this case, it is not the average power (75 watts) that is important,
but the amount of power that carries information, which is the
difference between the high and the low power, so that would be
approximately 50~ish watts.

There is nothing wrong with your radio.

6409. Re: [TS-850_450_690] 100 watts in AM on 850 is this normal ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-02 09:56:44 UTC
From: Steve Gehring
Topic: 6403 Message: 6409

Please never try to modulate your kenwood rigs on AM with more that 25
to 40-watts carrier power. For greater verification, please read the
about 20 to 25-watt carrier comments on this eHam thread:

http://www.eham.net/articles/9842

One speaks of his TS-450S also. I'm sure my method will work fine for
that rig also.

My procedure stands thus...

Tom,

You may have already worked this out from the answers you have
received so far. As I understand your question, nobody has messed
with the AM operating part of your TS-850. In AM, you manually adjust
both the carrier level and modulation level. It should be adjustable
from close to zero up to 100 watts. That does not mean you can
operate it on AM over that whole range. You must set the carrier
level to an appropriate output power. Nominally, this should be 25
watts since PEP output from an AM transmitter is 4 times its idling
carrier output power. Your mic gain should be set to just produce 100
watts output. The Japanese transceiver manufacturers often specify 40
watts carrier output. This will actually work but will sound a bit off
to regular AM operators. Since you obviously cannot achieve 4 times
40 watts output - 160 watts that is - something must give. You could
either limit your mic gain so you just barely reach 100 watts output
on voice peaks and get much less than 100% modulation or you can crank
the mic gain up higher to achieve a higher percentage of modulation by
causing the ALC circuitry to cut the carrier level back to 25 watts on
voice peaks. The best way is probably to start with setting your
carrier level to 25 watts.

Hello from a new member with TS450S questions. Just bought used 450S and wonder if anyone can tell me if the speech processor is RF or AF type processor. Getting good audio reports so It doesn't really matter except for my curiosity. Also, is there a way to lower the CW sidetone pitch, it is too high for my liking. Thanks for help, this seems like a good group.....Mike

speech is AF (audio frequency)...

is there a menu setting for sidetone pitch?? i do not own a 450, have to wait for an owner to tell you that one, or check the manual(last resort, hi hi)

the ts850 has a "pitch" button on the front that can be changed, maybe the 450 does??? as well

6415. Re: 100 watts in AM on 850 is this normal ? "Down Modulation"??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-05 02:35:07 UTC
From: John Oesterling
Topic: 6403 Message: 6415

"Down modulation" is a CB term which typically meant the meter is
going down when you talk and really means little to nada nor does it
correlate with modulation linearity.
The best way to adjust your rig is with a cheap scope to look at the
RF envelope to insure you aren't clipping which translates to
spurious emission and splatter.
In any case the manufacturer instructions are the best way to go with
running the 850 on AM.

6417. Re: [TS-850_450_690] Re: 100 watts in AM on 850 is this normal ? "Down Modulation"??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-05 10:05:31 UTC
From: Steve Gehring
Topic: 6403 Message: 6417

Actually, the 850S instruction manual has the rig operating at 40 watts. It's wrong... That's way to much carrier. The 850S at 40 watts carrier causes distorted transmissions on my rig. 20 to 25 watts carrier (RF power control max, carrier controlled by the CAR control), reduces the distortion to nil. Knowing and understanding the basic physics of an AM modulated carrier are "key" to properly operating an AM transmitter like this. If this is understood, 40 watts carrier operations is "too much" for a 100-watt rig with a properly adjusted and working ALC circuit.

Yes, as scope setup or station monitor would be nice. But one can carefully monitor with an outboard receiver -- like I do -- with my 50-ohm dummy terminated R-75 and a pair of headphones in the same shack.

6418. Re: 100 watts in AM on 850 is this normal ? "Down Modulation"??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-05 12:28:57 UTC
From: ve9xyz
Topic: 6403 Message: 6418

I noticed the reference to using a "cheap scope" to obssrve the AM transmissions of our rigs. I'v always assumed that the fellows were using an expensive scope and special interface with their transceiver. Maybe my old beat-up scope can be pressed into service for this. Can someone explain how we set up a scope to get a realistic picture of what's going on? I'm guessing that with the power levels involved, one doesn't need a direct connection.

6419. Re: 100 watts in AM on 850 is this normal ? "Down Modulation"??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-05 13:35:52 UTC
From: John Oesterling
Topic: 6403 Message: 6419

I strongly disagree, understanding the physics of AM requires working knowledge of Fourier transforms and signal components e.g. Gaussian noise. That is not necessary to operation of a radio. You just have to be able to read and follow instructions. Ham equipment has type acceptance contingent on following the manufacturer's instructions to operate said unit. As to being able to monitor for proper modulation with an outboard receiver; no matter how carefully, it is not possible. Not only have I proven this time and time again with program directors at radio stations where I chief'ed as broadcast engineer but have "straightened out" numerous AM stations cited for non-compliance with FCC regulations in stations where the program directors thought they could be the engineers when the FCC dropped the requirement to have a engineer with a first class phone. On a scope, every time you see a bright dot between Christmas trees, it correlates with >100% negative peaks... splatter and distortion.

6420. DRU-2 and filters sell for Kenwood TS-850s

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-05 17:26:31 UTC
From: Janez
Topic: 6420 Message: 6420

Hallo group, I'm sorry to say but I will leave this fantastic
group soon. I know that the users of this group will tolerate my
sellings here, since you know the value of this goodies.

I sell my old working mule TS-850 few days back.
(Short on cash, can't keep it.)

The new owner don't want the DRU-2 unit (with cables, screw
and homemade external copy of remote control
RM1 - 6 buttons - all 3 play, CLR, M-in and MR).
I'm sorry just European union buyers because of customs
troubles. Also can't accept PayPal.
Will sell for 120 euros plus shipping.

Also aviable following CW filters:

Inrad #103 400Hz 8,8kHz - new filter.
Price 100 EU plus shipping.

YG-455CN-1 250Hz 455kHz - old but workable.
Price 110 EU plus shipping.

All questions only to
my e-mail address: s51dx@...

Thank you all for fantastic forum,
especialy to the moderators.

Best regards and hope to hear you all
on the bands with all time legendary
Kenwood TS-850s.

73 de Janez S51DX

6421. Re: [TS-850_450_690] Re: 100 watts in AM on 850 is this normal ? "Down Modulation"??

Yahoo group: TS-850_450_690 (2006 — 2009)

Topic: 6403 Message: 6421

John,

If you are so inclined, address distortion-less transmission of a
TS-850S, given the TGC/ALC circuitry aligned for roughly 100 watts PEP,
while operating at 40-watts carrier (reference page 28 of the
instruction manual, I believe). As you and both know, this rig wasn't
designed for 160-watt PEP transmission with any degree of linearity --
it isn't even setup or designed to do so.

And please don't tell me distortion isn't present at 40-watts carrier,
addressed by an "after the fact" reactionary system -- the closed loop
TGC/ALC management in the 850S.

Oh... I still work in the comm and telecom industries in similar
capacities. Please don't pull your "trump" card again...

6422. Re: Upgrade my TS-450 for a TS-850 ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-06 03:15:56 UTC
From: ve9xyz
Topic: 6391 Message: 6422

Steve mentioned a review of the 450/690 and 850 in QST (must have
been in the 90's I would presume). Would anyone have a copy of that
article they could scan and send to me? (or place in the group files
section perhaps).

Thanks,

Kevin, VE9-XYZ

Hi Kevin,

It is available free on the ARRL web site. Our Internet is down now, or
I'd look for you. You can find it with Google using

Product Review TS-850S site:arrl.org

Hi Op's,
I am looking for help regarding the MFJ-1026 Noise & Interference Canceler. I bought this to see if it helps me on Top Band. I have a half wave dipole of 254 feet long with 1:1 swr.
I thank you in advance for any reply and hope to meet you also on Top Band.

No thanks Steve, since you assert that academic knowledge and
experience threaten you as a "trump card" I will refrain further
comment; at least to you. Good luck to you in the future.

6427. TS-850S Comp Control.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-06 13:45:58 UTC
From: terry
Topic: 6427 Message: 6427

Hello, could I ask TS-850S users for their help please.

My partially sighted pal is using his TS-850S via computer control, mainly as the frequency display window on his software is larger and easier to view than the display on the radio.

The one and only problem he has come up against is when tuning the radio via the vfo knob the softwares frequency display is very slow to catch up with the radios tuned frequency.

In reverse when he tunes his radio from the software the radios frequency is almost instant so tracking is good.

As the radio's baud rate is fixed at 4800 B it is not possible to try different baud rates for him - I cannot find any other setting that can be altered in the radio.

Is the problem been caused by slow data been sent from the radio to the computer I wonder ?.

Does any other TS-850 user find the same when using with computer control ?.

As above he only wants to use computer control really as a larger software display is the plus side for him.

Many Thanks.

Terry.

Hi Terry,

Yes, if you look in the control manual for the TS-850 (and other Kenwood rigs - I believe they all use the same format) the frequency is sent as an ASCII character string to the rig. At 4800 baud, it takes a bit of time to send 8 or 9 ASCII characters and decode them in the radio. Rapidly changing frequencies, there is definitely a lag in the computer > radio interface. Not much you can do but live with it!

Terry,

What software is your buddy using? Most have a place where you can adjust the polling speed of this software. This determines the interval at which the software is reading data from the radio. I always set the software for the fastest polling speed possible, usually somewhere in the area of 100 ms.

Max

Hello Max.
My pal has tried Commander by Dave AA6YQ I have tried setting
the polling speed of Commander down as far as 50 ms - it does make a small
amount of difference to the speed of the display but not much at all - I
think my pal will now go the other way and use Commander as it should be
used and tune the radio from the software and not the other way round - at
least he will be able to use the larger display of Commander.

Thanks all for the replies and help.

73es.

Terry.

Terry,
Is you friend using Window eyes or jaws as a visually impared person's screen reader? These programs for the blind (and visually impared) can hog all kinds of memory and other computer resources. My brother (WY2D) is legally blind. I set him up with these programs and they do work well. I would suggest he might research these programs and see if it is compatible with the CAT software he is using. The reason I suggest this is simple. God forbid, he experiences additional sight loss, he needs to have a fall back platform to use. These are the very best synthesized screen readers, and he could just listen as he tunes and sets up his rig. The Caveat is, it depends on how the cat reports the radio data. If I can be of help, please contact me off line email. I have set these programs up for many visually impared and blind persons. The lighthouse for the blind is also a very good source for additional resources. Also a group called Handihams (handicapped amateur radio operators) has additional onto that might help. Please keep in touch and let me know how you make out.

Hi.
His interface is the G4ZLP interface which is very much used over this side of the pond - i have several of them and they work fine.

I think we are talking at cross purposes -- he is able to tune the radio via CAT and the software - tracking is very fast, all he is wanting to do really is to be able to tune the radio with the radios own vfo knob and read the frequency from the softwares display window which is larger than the radios display -- I suppose in one sense all he is looking to achieve is using the softwares frequency display as sort of a large extension frequency readout.

The 850 certainly does have the reputation of being a good radio that is for sure - it seems that he has made is mind up and wants to go for a 570 ! He has one on his desk now with a view to buying it ! As said in a previous post if he does decide to sell the 850 there is no doubt about it I shall buy it.

Thanks.

Terry.

What type of interface is he using? Mine is homebrew and as I said it transfers data pretty quickly. Using HRD you can tune the radio as normal and the display in HRD tunes along. Also you can click on the screen and the radio will tune accordingly. Isn't this what he wants it to do? I have also owned the 570, and although newer it does not have the same receiver performance as the 850. Although it does have DSP.

Max

Sorry Max, I did not read your last post correctly.

Yes the below is just what he is wanting to do,it does work but the tracking seems very slow when tuning the radios vfo, the software takes a second or two to catch up with the radios displayed frequency.
Terry.

Using HRD you can tune the radio as normal and the display in HRD tunes along.

I am using HRD and it tracks fine as long as I tune at a somewhat slow pace (I hunt for DX) but if you tune too fast it will take time for the software to catch up. I do like the DX Cluster on HRD just click on the DX station and instantly your radio is there correct frequency reading & mode and all Very Nice :=).

Hi.
Thanks very much for the info, no as far as I know he is not using the
below software but I have noted it and shall pass it on to him tomorrow !
Wednesday !, he has not had sight problems very long ! Caused through an
accident at work ! So he is still coming to terms with the disability.

Right now he is keen to be able to get back to his Ham radio hobby - he rang
me this evening to say that he had indeed bought the TS-570DGE it tracks
fine with the various CAT programs that are available.

I have bought the 850 of him a very nice radio as well.

Anyway will close this mail now.

Thanks for all the help is is appreciated.

73es.

Hi Roland, as my mail to the group a few minutes ago - I have now bought the TS-850S of my pal.

I am running it with Ham Radio Deluxe as you say it is possible to track ok so long as you tune the radio slowly.

I also have a TS-450 that I run with Ham Radio Deluxe - both software and the 450 run fine together with non of the tracking problems even when tuning quite fast.

Many Thanks.
Terry.

I am using HRD and it tracks fine as long as I tune at a somewhat slow pace (I hunt for DX) but if you tune too fast it will take time for the software to catch up. GE all
Has anyone changed the stock 2.7 filter to a 2.8 inrad?Is it worth doing? I happen to have a spare and had given it some thought,but figured if its been done,someone on this group has done it!

Hi Neil,

I wouldn't think there would be much use in going to the trouble of swapping the filter for that little difference. Of course you could mount it on some perfboard and solder some RG-174 coax to the optional filter pins for a quick trial and error.

Another option is the YK88S-2 SSB filter. This is the stock filter in the 930 and 870 radios. It is 3 Khz wide. I have done this swap before and it makes a bigger change in both rx and TX.

From: Paul Spiteri
Topic: 6442 Message: 6442

Hi all,
I just bought an MFJ-1026 and the manual recommend using this phono connector to switch the transmit mode. The MFJ switches out-of-circuit whenever the line is pulled low (below one volt). Never apply negative voltages, or voltages over 15 volts positive to this jack.
Connect the TR/Control with an external PTT source. Many modern tranceivers have an External PTT output pin. This can be used to pull the TR/Control line LOW.
Can someone please tell me where can I contact the TR/Control with the TS-850 ??
I did not found any External PTT on the back of the TS-850.
Thanks
73s

Paul,

On the REMOTE connector there is a pin that is pulled to ground when you key up. It is used for keying amplifiers. I have posted the pinouts in the files section.

Has anyone seen this regarding the 450/690 IP3 test published in QST?

http://www.nitehawk.com/sm5bsz/dynrange/rig_compare.htm#14_TS450S

This guy says he can't reproduce the ARRLs "unusual" results.

I'd be interested to get some comments regarding his results--he theorizes that the 450 design he tested was somehow "modified" over the one the ARRL tested.

ptt in the 13 pin din is either pin 9 or 13, (not pin 1) depending on model. you can also wire pin 9 with a diode to pin 13.....

ground is pin 4, 8 and 12

hello all,

Im new to the group and first want to say hello and im glad there is a sight for getting info for keep up these great radios. with that hes my problems im having

I just bought this ts-580s and when you first turn on you have to wait about 2-4 mins for sound to come on then it take a few more seconds for the sound to clear up...after that work great

2nd after warmed up every min or so the meter will spike and the RX goes away just for a brief second. Might be the same problem as the first causing this not sure im no exspert on radio

hope some on can help..

Robert,

You can download a copy of the users manual in the files section of
this group. It is in the "MANUALS AND SCHEMATICS" folder. Nice deal on
the 850. Excellent radio to say the least.

Topic: 6453 Message: 6453

Hello Group,

Does anybody here have any experience using 6 meter repeaters using the 690-S? After looking at the manual, I see that a TU-8 tone unit is needed to set tones. I can't find one, but can find a TU-8x tone encoder from Piexx.com. Does anybody know about these and if they are worth using? The repeater I am trying to use has a -1.7 tone setting. I did not see any minus settings when looking at the TU-8 link on this site. Am I missing something? I don't want to buy this unit and find out it is not usable. Am I entirely off base with my concerns?
Help!!

Thanks

Tracy

Go to http://www.hamuniverse.com/repeater.html and read the article.
It explains repeaters very well and will answer all your questions.
And yes the Piexx board is a direct replacement for the discontinued
Kenwood board.

6458. Looking to purchase A TS-850S and have questions

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-14 17:49:37 UTC
From: Pat Miller
Topic: 6458 Message: 6458

Hello all. Just joined this group. I am interested in purchasing a used TS-850S and I would like to ask a few questions.

Just a bit of info on myself...I currently have an IC-718, its been a good radio, but time to upgrade. I like DX, I am really starting to get interest in contesting. I have decent antennas with dipoles, a vertical & a tri-bander up 50 ft. I have been steered by some respected ham friends to strongly consider getting a TS-850S or SAT. So......

1. Is there much difference in the serial numbers vs performance/reliability/operation of the TS-850's vs later serial numbers? If so, what s/n and above should I look to focus on?

2. How about options? Which options do you have that you really like and use quite a bit?

3. Any particular weak areas to be concerned about of the radio?

4. Are parts still available if they are needed?

5. What do you like most about the radio?

6. What do you dislike most about the radio?

7. Any other feedback/info tips on looking for one is very much welcome.

8. What are you considering for your next radio.

----any and all answers are greatfully appreciated.

Early model runs had DDS chips on the CAR board that were prone to
failure. I believe anything in the 40 million and up serial numbers
had the newer IC's.

> 2. How about options? Which options do you have that you really like
and use quite a bit?

500 Hz CW filters in both IF's. Absolutely fantastic for CW and RTTY
contesting.

> 3. Any particular weak areas to be concerned about of the radio?

Capacitor leakage on the CAR board, memory battery leaking on the
digital board.

> 4. Are parts still available if they are needed?

Most still available, except the front panel.

> 5. What do you like most about the radio?

Everything. All the buttons do what they are supposed to do. The front
panel layout is great.
> 6. What do you dislike most about the radio?

Wish it had built in DSP, even audio DSP would be nice.

> 7. Any other feedback/info tips on looking for one is very much welcome.

Get something in the 40 million serial range or newer. Subtracting 2
from the first number of the serial number will tell you the year the
radio was made.

> 8. What are you considering for your next radio.

As long as my 850 stays healthy, I have no plans to replace it. But I
would love an Icom 7800! To sum it up Pat, the 850 is one of the best
used radios out there. And for $700 dollars it will still runs circles
around a lot of the newer menu driven DSP rigs. The receiver is second
to none in a contest scenario. I used my 706MKIIG during Field Day one
year and almost gave up, the receiver just couldn't handle the crowded
band conditions. The 850 doesn't flinch in this area. With the slope
tuning you really don't need any narrow SSB filters, spend your money
on CW filters instead. I'm currently on my 5th 850. In between I've

had many radios in the shack including a lot of newer ones. But I am glad to have the 850 again.

The units in the first year and a bit of production had DDS chips that are prone to fail. Avoid the 20 and 30 million S/N units unless the DDS board has been replaced or reworked (replace the 6631 chips with 66312 chips).

Naturally, the newer the unit the better. Look for a unit with a 50 million of later S/N.
> 2. How about options? Which options do you have that you really like and use quite a bit?
>
The Inrad 400Hz CW filters are the way to go.

I don't use the internal keyer, preferring my Logikeyer.

The Antenna Tuner works really well. (No substitute for a Transmatch with non resonant antennas.)

> 3. Any particular weak areas to be concerned about of the radio?
>
The radios are starting to get old, so a few failures are being seen:

The battery needs to be replaced before it leaks and damages the circuit board.

There is an issue with some 16V electrolytic caps on the DDS and PLL board that are starting to show leakage failures.

There is a DC-DC converter board that is prone to fail. The parts are still available and are not expensive - pick up a spare.

A complete realignment would be a good idea due to the age of the radio.

> 4. Are parts still available if they are needed?
>

Most of the -critical- parts are available. But, keep in mind that
this -IS- a 10 year old (or more) radio. Some of the mechanical
parts are no longer factory available.

I have been seriously thinking of picking up a parts unit just in
case.

> 5. What do you like most about the radio?
>
Fantastic receiver. Really strong front end. Great filtering
especially with the Inrad filters..
The 'Slope Tune' is a really great feature that is VERY
helpful during noisy or crowded band conditions.

> 6. What do you dislike most about the radio?
>
Lack of a second receiver for DXing.

Lack of DSP noise reduction. I really wish I could get a
DSP add-on with a noise reduction algorithm like that in
the TS-480 NR2 function.

> 7. Any other feedback/info tips on looking for one is very much welcome.
>
Especially useful mods, IMHO:

The noise blanker mod.

Use of the Front Panel MONI control to set CW sidetone.

Replacement of the original battery with a holder that
allows easy battery replacement.

Defeat the AM Broadcast Band attenuator.

> 8. What are you considering for your next radio.

Hello,
answers to some questons below....

> 2. How about options? Which options do you have that you really
like and use quite a bit?

Internal antenna tuner...works great

I have 240Hz filter in 8.8 IF and 500Hz filter in 455 IF (I got the
8.8 first and if I had known better would probably have gotten the
5oo Hz filters for both IF's.

> 3. Any particular weak areas to be concerned about of the radio?

Others have addressed this

> 5. What do you like most about the radio?

I have owned my 850SAT since 1993 (50 Mil Serial number). Original
cost with CW filter was $1800.
It has one of the strongest receiver front-ends out there.
Great contesting rig. CW or SSB.
One of the best arranged front panels on any rig I have seen.
Great transmit audio when properly adjusted.
RF/IF level speech processor/compressor. (a little dab will do ya!)
VFO/Memory panel very easy to operate.
Quick memory very usable in a contest.
Built in keyer with memory.

> 6. What do you dislike most about the radio?

Noise blanker is useless until the simple mod is made. Then it works
well.

They put an unnecessary attenuator in the broadcast AM band.
(relativey simple mod is available)

No separate input for straight key or computer keyer if you also want
to use the internal keyer. (a simple mod brings the key line out
for this purpose.)

CW monitor is not adjustable. (also a mod available)

No separate jack for PTT Footswitch. (Adapter can be wired up fairly
easily.)

No RS-232 level computer interface. Must build your own TTL level
converter or buy their expensive one.

It was produced before the 6-pin mini-DIN standard for packet/sound card interfacing was developed. Must use a clunky 15 pin cable.

NOTE: All of these are minor frustrations, in fact I have not even done most of these mods, except the noiseblanker and the 60 Meter mod. I have been an 850 Lover for 14 years.

> 7. Any other feedback/info tips on looking for one is very much welcome.

If you can get the DSP-100 unit with it for a decent price, grab it! It will add to your resale value.

> 8. What are you considering for your next radio.

The only things that have caused me to even think about trading in my 850 are the Ten-Tec Orion II, and the FLEX-5000. And I don't have money for those! I wouldn't even consider an Icom 7800. I have bought new cars for less than that! I can't see that one of those is worth more than two Orion II's. But that is another posting!

As others have said. In my opinion.....A used 850SAT is probably one of the best values on the market, and still one of the best performing rigs available for less than about $2500.

Date: 2007-11-15 06:04:31 UTC
From: John Kramer
Topic: 6458 Message: 6467

* 1. Is there much difference in the serial numbers vs performance/reliability/operation of the TS-850's vs later serial numbers? If so, what s/n and above should I look to focus on?

I bought my TS-850 SAT new back in 1992 or 1993. I have just checked, it is a 406XXXXXXX serial number

unit. It has NEVER given me a moments problem. The battery..and everything else is still original.

Never a problem with the DDS chip, or PLL unlock on my unit.

Surely one of the best radio's made for the amateur market. I now have a FT-1000 MKV, 2 x TS-2000,

2 x FT-890 AT, 2_x TS-940 SAT, TS-440 SAT, IC-706MK11 G, IC-7000, FT100D, FT-817, IC-703,

and of course, my trusty TS-850 SAT. I stubbornly refuse to sell my TS850, and it still gets good use and

gives me lots of pleasure. If Kenwood brought it back I would be first in line to buy another. One of

the few things I would change, would be to go back to an analogue meter, I don't care too much for these

new digital bar type meters - but that is minor - the quality of the rx and tx audio is awesome. I prefer

the 850 audio to the dsp audio from my ic-7000 or ft-1000 mkv. To me DSP audio sounds hollow.

Good luck, and 73

Thanks all so much for being very specific. Those specific points are the kind of responses that become extremely helpful. Yes I will be adding a TS-850 S sometime in the near future. You all have helped me make up my mind. It seems that anyone who has own one absolutely loves them. Thanks Again.

Has anyone ever noticed the edges or portions of the display on a TS-850S dimming? Not the entire character but just the edges. It happens on mine after it has been running for awhile. Just noticeable enough to notice and annoy me because something isn't right.

Steve, N4JQQ

A little more detail on this.....it is only apparent from the filter display to the right side of the entire display. The little boxes that display the filter selection for the two IFs are dim along the bottom too. Kind of like a shadow.

Dave I believe they are only available from Kenwood Service Centers.
From East Coast Transistor:

YM6631 IC(DDS) TS-850S TS-690S TS-450S(you will automatically get
the newer version-YM66312 $28.00

they take major credit cards.

The DDS chips are $28 each Dave. By ALSC swinging are you referring to your output power going up and down? I assume you are aware of the issues with the DC-DC converter board??

The power changing is the DC/DC converter board, not the DDS chips.
This is well documented. Of course you can change the DDS chips if you
desire and then you get to change the DC board to fix the problem.

I have had filaments break in bulbs, and reattach (almost an arc weld), if they reattach in the wrong spot, they effectively have changed resistive value, and therefore shine with a different intensity.

If you lift the cover off, you should be able to see if all the bulbs are lit.....if they are the same brightnes, then I am wrong

Hi Anastasios

Easy way to go would be go on eBay and do a search for G4ZLP. He has some really great interface cables for the Kenwood. I bought 2 of them for my TS450SAT's and one for my Yaesu 840. He is very quick on delivery, the price is right, and he really stands behind his product. It took 6 days from the U.K to Oregon. 73

A happy buyer.

Hi all
The SSB filter for TS850 is YK88SN-1, but in my old TS430 I've a YK-88S. Is posible to swap this to the 850?

Thanks

Xavier

Hi Xavier

I doubt it. The TS-850 has plug in filters (at least my 450 does) and the 430 has solder in filters. 73

The other problem is that the frequency is slightly different.

Hello Anastasios
What software uses to rig control?
What software uses to control? However you must set the parameters
properly.
Eg.for easylog 5 the set is:
Port com Number:1,2,ecc.dipends your pc
Baud:4800
Parità:no
Bit Dati:8
Stop Bit:2
Controllo di flusso:Hardware RTS/CTS

Aloha all,

I have a 850 that the display is out untill 10 seconds after turn on
then it comes on brighter than should be than gets normal after about
10 minutes. Is this C17 on the display board? Otherwise the rig works
great it is in the 2 mil serial range I changed out the DC/DC board and
had Clif change out the caps and 1 of the DDS chips on the CAR board.
Any help will do I want to get this rig 100% with no issues than sell
it as I already have a 850 that works perfect.
Thanks in advance.

I would look closely at C17, it's probably leaking but hasn't caused
any damage, YET. The juice (???) that it leaks is conductive...

6505. power surge

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-11-26 06:18:27 UTC
From: John Kramer
Topic: 6503 Message: 6505

Att: CLIFF

While this is not entirely TS-850/450 related, I hope Cliff or someone else can shed

some light here.

I have a TS-940 SAT (built-in psu) that becomes dead only when - the rig is turned

on, and the power company has a failure and I lose power. Then.when the power

returns - with the rig still switched on, a power spike, or something enters the 940

and kills a protection device. After the power returns the rig is dead, will not switch

on.

Does anyone have any ideas ? Yes, I have checked out the fuses, and have gone as

far as checking the output on the transformer, and the correct dc is getting from

the transformer to the rig.

PS. This is a 220v psu rig

Thanks

John

I take it this happened only once. It reads like it happens every time
the power is lost.

First check the timer button, is it pushed in?

Do you have a schematic and board layout for the AVR board? If so
check the 21v supply. If it doesn't work the radio will not turn on.

I have a TS-850 that has recently developed a problem with low audio in SSB mode. AM for example seems as before but in SSB and CW the output audio is very low. It does not matter if I use the speaker in the rig, headphones or an external speaker. A friend of mine suggests that it is a diode that is leaking. Hoping that I might have this confirmed (or refuted!) Any help would be appreciated.

Thanks for the reply Cliff. It has happened once before - and I had it repaired at the "local" technician - he is 450 miles from here...but the problem is...he took 8 months to get to working on it. The average time is between 6 and 12 months to get a rig back.

The timer is not on - nothing was touched on the rig. I had it tuned to the BBC, and was at the other side of the house when the power went off. The power came back on 10 minutes later - with the 940 still in the 'on' position. I came back in the room to see everything else all on - lights etc, but the 940 was off although its power button was still in the on position. Nothing was touched, no timer button or anything else between the time that the power went off, till when it returned. (I don't use the timer, it stays off)

I do have the service/workshop manual for it, and did a very quick check on the AVR board. There appeared to be 21v on the board, but I wasn't sure where the next step would be to check.

Thanks again for the reply

Look at the schematic and start checking voltages on the connectors.
If any vary from what the schematic shows then look where it comes
from and figure out what is wrong.

Cliff

Thanks for the mail, It looks like I have found the problem. I applied
power,
and then went checking voltages on the AVR unit. 28 volts was going to
the
final unit and also to the on/off switch. With more checking, I
deduced that
transistor Q6 must be the culprit, as it wasn't providing 21 volts
like it should
have. I switched on a powerful light, and had a good look - sure
enough, Q6
had blown a quarter of it's body away.
I will replace it when I can get to a big city to purchase one -
hopefully that
is the only component that has blown.

Thanks again for your help

Thanks Bob, but I think I will be able to source the parts here.

For other users that have an unstable power source, I found this

interesting mod. It only appears to be applicable to older 940□s,

which applies to me, as I have two 940□s □ a 7XXXXXXXX serial

unit, and a 6XXXXXXXX one.

Here is the mod I found

Kenwood TS-940S (TS 940 S TS940S) AVR unit capacitor change

In those areas of the country that are subject to large

power line voltage fluctuations, excessive voltage may

be applied to capacitor C12 on the AVR unit (X43-1500-00).

These voltage fluctuations might exceed the capacitor

breakdown voltage. Replacing capacitor C12 with a

capacitor having a higher breakdown voltage will help

prevent this potential problem.

Procedure:

On the AVR unit (X43-1500-00) change C12 from a

6800 µF capacitor to a 5600 µF 25 V capacitor (C90-2037-05)

Cliff

Thanks for the mail, It looks like I have found the problem. I applied
power,
and then went checking voltages on the AVR unit. 28 volts was going to
the
final unit and also to the on/off switch. With more checking, I
deduced that
transistor Q6 must be the culprit, as it wasn't providing 21 volts
like it should
have. I switched on a powerful light, and had a good look - sure
enough, Q6
had blown a quarter of it's body away.
I will replace it when I can get to a big city to purchase one -
hopefully that
is the only component that has blown.

Thanks again for your help

check for rf gain control or attenuators being turned.....rf gain turned counter clockwise will reduce receive, and will affect the audio (depending on the signal

am signals may be coming in well over the threshold

Subject: [TS-850_450_690] TS-850s Audio Output probem

I have a TS-850 that has recently developed a problem with low audio in SSB mode. AM for example seems as before but in SSB and CW the output audio is very low. It does not matter if I use the speaker in the rig, headphones or an external speaker. A friend of mine suggests that it is a diode that is leaking. Hoping that I might have this confirmed (or refuted!) Any help would be appreciated.

Hi Ian,

Here's a possible cause of your problem that you can check,
if you're willing to dig inside and take some measurements...

>>More information provided by Grant, K1KD:

22-04-2000 TS-850S Low/no Receive sensitivityReports of low or no receive sensitivity accompanied by a lack of audio
from the speaker during CW or SSB modes might be caused by improper RXB voltage levels. Normal RXB voltage is +8 Vdc during receive and 0 Vdc during transmit. If you find approximately + 2 Vdc during receive you might suspect a problem with a leaking diode, D31 on the RF unit (X44-3120-00).

Cause: D31 is used as the transmit switching diode. Leakage of this diode is most probably caused by electrostatic surge or discharges from the antenna.

Parts required: D31, MI204

Procedure: A temporary cure for units that have already been manufactured is to replace D31 with an MI204 diode. Future production radios will change D31 to an LFB01 diode and incorporate a change in the printed circuit foil pattern to allow addition of a series diode.
D103 (LFB01).<<

Usually the zener (D14) beside it goes also. While shopping get the
pass transistor (Q103) that is mounted on the heatsink that Q6
controls. Don't use the plug on connector on it, solder the leads to
the transistor. That should take care of it.

Okay Clif

I had already added Q103 located on the heatsink onto my shopping
list, although
it checked out okay. I hadnt added the zener diode D14, to the list
though - thanks
for that. I will be going down to a large city this weekend and
hopefully get the
parts. Thanks again Clif

6523. TS-850 PROC function dead

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-02 19:54:24 UTC
From: ha7wac
Topic: 6523 Message: 6523

Hi All,

Seems my trusty 850 (made in 1994) is getting old and needs new components...

For a while the PROC function started to work sometimes, sometimes not, more and more often not.
Now it almost never works. You will say it is not a too important function, but i wonder it could be a start for other functions to go wrong...

Has anyone of you had this kind of problem, and what was the component to change?

Thank you for any idea!
vy73 Chris

6524. TS850 odd display behavior and no xmit

Yahoo group: TS-850_450_690 (2006 — 2009)

From: jeffthom99
Topic: 6524 Message: 6524

Hi All,

I guess I have old 850-itis. I was happily scanning along 40m when suddenly, my display reverted to all decimals lighted and all sound output cut off. No RF/transmit function, even in tuner auto tune. Touching the tuning control or entering a frequency manually results in a brief 1/2 sec (correct) display, then back to all decimal points. And the audio monitor emits Morse "UL". I have been through the manuals and cannot find any normal state that gives either a display of all decimals or the "UL" audio prompt. The lost audio and odd non-transmit behavior led me to remove the mike connector to eliminate a bad PTT switch or wiring problem (Kenwood Lesson #1 for me). No joy.

All voltages seem OK, short of disarticulating several bolt-in boards for deeper analysis. However I thought it would be better see if this is a previously found 'easy one' before tearing into the guts. Any ideas will be very welcome! 73's and thanks. Jeff, KB3NAX

Jeff...my 850 had same trbl couple of yrs ago. The shop replaced the 2 DDS chips, VCO2 board and about 10 electrolytic caps. The "UL" in morse is rig telling you the VCO is unlocked and the dots on the display same. Mine was about 400 bucks labour, parts and allignment. gl es 73 Tom VE3THR

Jeff,

As the others have mentioned, the "all dots" and "UL" in code is a sign the VCO has gone out of lock. Before plunking down serious cash to replace boards, measure the VCO voltages as per the service manual. A simple retuning of the VCO's may be all that is required. If that doesn't fix the problem, then check for leaking caps on the CAR board and DIGITAL boards.

First rule of servicing: Alignment does not cure a hard failure.
Trying to align to fix a failure mode only further hides the real cause.

That being said. VCO 1-4 are 4 separate VCO's covering 0-30 MHz. If it only blanks in one segment it "could" be an alignment issue. If it blanks on all 4 segments then VCO 1-4 are not at fault (what are the odds of 4 separate oscillators failing at the same time??).

More likely is LO2 VCO which is operational all the time. If this one is unlocked it is usually the trimmer cap has oxidized. Turning it several times to sorta clean it and alignment may work for a while. Best to replace it.

All 5 VCOs depend on the reference oscillator running and the signal being divided correctly. If it stops or if a divide by chip fails the radio unlocks.

VCO 1-4 depend on DDS1 (one of the famous DDS chips) operating properly.

All VCO's depend on the correct PLL data from the microprocesssor.

First isolate via the unlock line which VCO is unlocked. Then analyze what external factors could cause it to unlock. Make sure the unlocked VCO has the correct input levels and frequencies. Trace back thru the schematic and see if the supply voltages are correct.

Clif

From: mopar_tech383
Topic: 6530 Message: 6530

Im not sure if this is an AGC problem or not and since this is primarily my backup rig im now sure how long this has been this way but I hear sharp cracks on the leading edge of lightning QRN and even on S9-plus signals. No, I haven't left the noise blanker on, but it almost sounds like that's the problem. Turning on the notch gets rid of the crackly noise but am wondering if others have seen this symptom and what the fix would be.

6531. Alignment of VCO's

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-04 08:36:46 UTC
From: John Oesterling
Topic: 6531 Message: 6531

My first message disappeared...weird, If you are going to do this remember to store the alignment frequencies in memory first. If any voltage is far off the mark, suspect that oscillator. As mentioned, these trimmers can oxidise as well as get cigarrette smoke and occasionally freon mixed with shellac within the plates. Oxidation also attacks these babies and sometimes you can position them 180 degrees from and get them to work. The best thing to do is to replace them. Mine would display your problem and then a slight tap on the case would cause the trimmer to remake connection. Good luck to you!

Thanks all for very good input. I have the service manual and
schematics now and I'll proceed from here with much fear in my heart

along the diagnostic tree suggested by Clif.

What is this about "Leaking Capacitors"? Did they use the cheapest stuff around or are they just marginal on voltage rating? If I tear out any boards I will for sure recap the darned things. Life is too short for a 10 cent part vs a 20 cent part to wreck my on-air time!!

And a scratchy trimmer, too. Good Grief - My 40 year old Swan rigs at least work, LOL. Hmmm. Come to think of it they got recapped too.

Have no fear, the group is here.

The service manual alignment procedure is actually a better troubleshooting guide than most realize. Start at the first step and act just like you were going to align it except don't touch any adjustments. Expect the voltages to vary a bit (less than a volt usually). Remember the alignment procedure is for an unaligned radio therefore it starts at the common areas and then in a logical sequence each step builds on the one before it. When you find the fault area it will be obvious. A voltage way out of whack. Study the schematic and try and figure out what could cause it. If you get stumped, THE GROUP IS HERE.

6534. Schematic for TS-850 Digitial Unit

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-05 20:29:56 UTC
From: wa2rwm
Topic: 6534 Message: 6534

I am trying to track a failure in the ACC1 interface to the Digital Unit, but I have no schematic to look at. Is there one out there on the Net?

Any help would be greatly appreciated.

Thanks in Advance,

Rich - WA2RWM

Rich,

You can download the service manual from here....

http://www.wz5q.net/index/manuals.htm

Scroll down you will see TS850S with schematics.

Good luck,

Max

6536. TS-850S Beat Tones

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-06 02:42:33 UTC
From: catdjc123
Topic: 6536 Message: 6536

I recently noticed that I could hear beat tones on my TS-850SAT on 10.000MHz (CW Mode) even though I didn't have an antenna connected. I found a reference in the instruction manual at the top of page 64 saying that "beat tones may be heard on 10.000MHz, 20.000MHz, and 30.000MHz. This is due to the internal frequency configuration of the radio and is not an indication of any problem. It is normal." I have never run across something like this before, but the manual says it is normal, so OK. However, I can hear the beat tones on every 1MHz increment. On some frequencies it is very low in amplitude, while others it is louder. The only frequency that is dead quite is 14.000MHz. Is this normal? Should the tone on 10.000MHz be S2 in strength? Below are some specific details of how I hear the tone on each frequency.

On my 850 I can hear the beat tones on the following frequencies:

Very slightly:
4.000MHz (louder with AIP off)
5.000MHz (louder with AIP off)
6.000MHz (louder with AIP off)
7.000MHz (louder with AIP off)
9.000MHz (louder with AIP off)
11.000MHz
12.000MHz
13.000MHz
etc. up to 29.000MHz.

Slightly louger:
8.000MHz

Very loud:
10.000MHz (S2 signal strength. S1 with AIP off)
20.000MHz (S1. Slightly less with AIP on)
30.000MHz (No SMeter reading. Louder with AIP on)

No beat tone heard:
14.000MHz

I am also curious if other 850 owners have similar results.

Dan, K1WW

Hi Dan,

I've always been aware of a tone on 20 mhz on my 850, serial number in the 71 mil range. So I went checking and with no antenna connected I only here it on 10, 20 and 30 mhz. On 10 is registers an S-1, on 20 it is most audible but no S meter reading and on 30 mhz it is barely audible with no reading again. I would be curious to know if there is a fix for this.

Probably not since the internal reference is 20 MHz and divided down
to 10 MHz for some circuits.

Clif,

I didn't know of/join the Yahoo Group until after you'd repaired my TS-850SAT. Since then, I've become aware of your continuing and helpful presence there. Thanks for being such a freely given resource of reliable information.

BTW, after some days of annoying intermittent operation of the internal TS-850 keyer, I located the problem: an intermittent cable connection. It was related to the cable connecting to CN2 on the IF Board (X48-3080-00). I would turn on the rig, and the keyer would be functioning normally -- or it might not be working at all (a crap shoot!). It got to the point where I left the top and bottom covers off the rig as I'd tired of removing all those lovely chrome-plated screws.

The "day of determination" came when I turned on the rig, found the keyer functioning, left the house for two hours or so (with the rig still on) and returned to find the keyer dead! As my former boss (W1FB, no blood relationship; I'm not his "N" nephew! :-)) would say, "G-r-r-r-r-r-r!" I found that with the top cover removed, and the rig upside-down, by installing the bottom cover the work/no work status of the keyer changed depending on where pressure was applied to the bottom cover. The area near the front-right was the trigger.

Off came the cover. I suspected that the cable connecting to CN2 might be fractured or shorting to the chassis frame over which some of the cable passes, but it turned out to be none of that. Simply removing the cable from CN2 and reattaching it cured the problem.

Happy Holidays!

Clif,

Using VE3TMT's data it seems that the beat tones as heard on Max's 850 would represent the correct normal case (beat tones on 10, 20 and 30 MHz). In my case I hear the tones on many other frequencies and at higher S-meter readings which I believe is not normal.

Any ideas as to what could be causing this?

List some of the other frequencies. It could be shorted filter diodes
which will cause problems in sensitivity. Then someone to overcome the
loss of sensitivity turned up the Rx gain all the way and Viola,
garbage all over, and reduced sensitivity. Plus the shorted diodes
will let in signals which are not supposed to be there causing
heterodynes.

Dan,

I may be out of touch with the original subject matter, but couldn't help but wonder if the "birdies" you're hearing may not be coming from an outside source, such as a nearby computer. I've not searched for birdies in my TS-850, but have heard a few. All of them I consider of no consequence because received signal and noise are of much higher levels.

The one ear popper I heard years ago was a 10-meter birdie [more like a pterodactyl] in a Ten-Tec transceiver; that one pegged the S meter!

Brings up an interesting point Clif. I notice my current 850 (70 mil#) and my previous one (30 mil#) both seem to suffer sensitivity in the 22 mhz area. As you tuned through the range you could or can actually hear the noise level drop as does the s-meter. It also did it with my FT920 which leads me to think it is the vertical. Probably not related but puzzling. This particular radio I know never had the covers off before I got it. So this 20 mhz tone is even more puzzling.

Paul,

Thanks for the suggestion. In my case it does not appear to be random birdies appearing on various frequencies. My TS930S sitting right next to the 850 is quiet. It is clearly the beat tone feeding through. It only appears on 3.000MHz, 4.000MHz, 5.000MHz, etc.

Hopefully there is a clue in the below information.

I can hear the beat tones on every 1.000MHz increment. On some
frequencies it is very low in amplitude, while others it is louder.
The only frequency that is dead quite is 14.000MHz.

I can hear the beat tones on the following frequencies:

Very slightly:
4.000MHz (louder with AIP off)
5.000MHz (louder with AIP off)
6.000MHz (louder with AIP off)
7.000MHz (louder with AIP off)
9.000MHz (louder with AIP off)
11.000MHz
12.000MHz
13.000MHz
etc. up to 29.000MHz.

Slightly louder:
8.000MHz

No beat tone heard:
14.000MHz

Hi All,
Does anyone have the circuit for the display dimmer? I have the full service manual but the circuit is drawn as a box labelled dimmer - not too helpful!! I know that the flourescent dislay circuit is driven with a 300v p-p waveform and the dimmer actually pulses this waveform on and off to give a 'dimming effect' but on my rig this is not working. I have checked tha actual switch - this is working OK but of course without the circuit that is as far as I can go. Any help would be more than welcome

Merry Christmas

I hope it was like new for 900 but that is also a retail store so thier prices will be higher. There are plenty 850's are going for 700-750 on ebay. I am selling one in the 2mil ser# for 625.00 with new the newer DDS chips that is about a 7.8 on the 10 scale. I would ask between $700-775 depending on how clean it is.

I've seen them go from $700 to $1000.

I bought mine in brand-new condition, with 400 Hz and 1.8 kHz filters, from someone on eHam.net for $900. I opened it up for all-frequency transmit because I use it now and then with transverters that have an oddball IF. That also enables the 60-meter band.

I also removed the broadcast-band attenuators (a matter of changing jumpers in the rig).

I've seen them go as low as $600 and as high as $900. I don't use eBay for any kind of pricing guide. It is an auction site and prices paid for gear on there are either high or low depending on the demand. Most of the 850's I've seen go for anywhere from $650-$750 depending on optional filters, tuner, voice board etc. I have also seen stock 850's listed in the $900 range, which is way too high for a radio as old as the 850. Even if it does run circles around some of the newer gear. I have a 70 million series model (mfg 1995) with tuner, 500 hz filter, all mods have been done (NB, BCB, tuner for RX, battery, CW monitor), built-in PC interface, and the radio is easily a 9.5/10 on the appearance scale. I still wouldn't expect to get more than $800 for it.

..besides, it's not for sale!

73 and Seasons Greetings to everyone on the list.

Hi Mike

Have a look in the TS930 group as well. These are the symptoms of PLL unlock - the display is all dots until the contols are moved. Do a search of PLL in the TS930/940 groups and have a look on Jeff King's page about the 940 (do google search). You will then have to determine which of the PLL's are out of lock and fault find accordingly. Then ask again

6561. Re: TS-850S Beat Tones

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-10 16:16:59 UTC
From: catdjc123
Topic: 6536 Message: 6561

I had a chance to investigate further this weekend. With no antenna connected I hear tones at the following frequencies in addition to the frequencies I posted earlier when scanning from 0-30MHz.

I think Clif may have called this one correct in thinking that someone has turned up the RX gain. With no antenna connected I noticed that I hear lots of static and static crash type noise hitting S2-S4 on the SMeter. This effect seems to lessen slightly as the receiver gets warm. Also, when searching for beat tones I heard two at 11.885 and 11.830 that on closer listening were clearly SW broadcast stations (I switched to AM) that were being picked up. My 930 sitting right next to the 850 does not pick these signals up without an antenna.

Tones were heard:
0-5MHz is clean except for the loud static crash type noise.
5.935
8.899
12.198, 12.137, 12.869
11.221, 11.954, 11.893, 11.885, 11.830 (11.885 and 11.830 were broadcast stations, maybe the others as well?)
13.114
15.105, 15.170, 15.984
16.168, 16.106, 16.839, 16.900, 16.961
17.083, 17.145
18.865, 18.899
23.127, 23.994
24.043, 24.959
25.875
27.157
29.113

Any ideas/suggestions would be appreciated.

If you are getting static crashes with no antenna hooked up you definitely have a problem. Preface that by saying, no antenna means a dummy load substituted for the antenna, not just an open port.

That could possibly mean the 850 has a more sensitive receiver than the 930, and we all know the 850's receiver was rated one of the best. One wouldn't think ANY stations would be able to be heard without an antenna connected, except perhaps the local AM broadcast band stations and some of the stronger SW stations.
I did a few further tests and any tones I hear are all on frequencies ending in .ooo, example 5.000, 6.000, 7.000 none of the oddball frequencies like you have listed.

With regard to the RF gain being turned up, that may be a possibility, but I am certain mine has never been touched and I am still picking up the tones. I would be afraid that if I was to decrease the RF gain to the point the tones disappear the signals on everything would be down too low. Except for the 20 Mhz signal I didn't hear any of the others when an antenna is connected so it isn't a big issue for me. However I do want the receiver to be as clean sounding as possible. The topic does deserve some further investigation.

Thanks for the info Dan.

My opinion: The rig should be in transit to Clif ASAP. He might've had the problem resolved by now so the 'ol '850 would have a truly peaceful holiday season and future life.

Wishing everyone Happy Holidays!

6568. Scratching in the audio

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-11 02:12:19 UTC
From: Tom Osborne
Topic: 6568 Message: 6568

Hi All

This past weekend my TS-450SAT started acting up.

With the antenna disconnected, a really bad scratching noise, kind of like an arcing, started, and got really bad.

With the antenna disconnected, it moves the S-meter when the noise comes on.

I took the bottom and top off and re-seated all the connectors and cables, and tapped or wiggled every thing I could think of, but didn't make any difference.

Any suggestions? Thanks, 73 and Merry Christmas!

I bought a 450 once that had the same problem and sent it back to
the guy I bought it from. It would also copy USB signals in USB and
LSB in USB it made no difference what SSB mode you where in.
He told me he had just replaced the DDS chips.
That could be the problem.

Paul,

Sage advice. I just wanted to make sure it wasn't something simple
that others had diagnosed before, but it looks like this 850 will be
having a date with Clif in the not too distant future.

Thank you to all for your assistance,

Dan
K1WW

The ATU on my 850 make a lot of screaching noises when it tunes. Does it have a moteized roller inductor inside that I need to lube or is this normal. Also my 850 keeps the memory contents just fine do I need to do the battery mod now or is it OK to wait untill it loses the momery contents? Thanks Jeremy N0NZG

You need to hook up a dummy load. As others on here have found out the 850 is very sensitive and an open antenna port will pick up noise. If it still has noise when a dummy load is connected then it's internal and needs to be fixed. If it goes away, you sure have a noisy shack. GRIN.

From: ve3tmt
Topic: 6575 Message: 6575

I have uploaded a recording of the tones heard on my 850 with a dummy load connected. No static is heard, anything that registered on the S-meter anyway, but you can really hear the tones on 10 and 20 mhz. I toggled through the receive range at 1 second intervals, so the 1 sec of play to 2 seconds of play is 1 khz, 10 seconds of play to 11 secondas of play is 10 mhz, you get the idea. May not be of interest but for those who wanted to compare the file is there.

73,

Max

Hi Clif

I hooked up the dummy load and the noise is still there.

I noticed something else too--when I put it in the FSK position and key the transmitter, it puts out the correct power, but the last red light or 2 in the bar graph were flickering instead of holding solid. When I switched the transmitter off, the noise was real loud. Looks like it needs some medical attention :-) 73

Have you checked the service manual on the TS850? The schematic shows where the IF tap was taken from. May be able to duplicate on the 690?

Also in the manuals for the older TS520 and TS820's showed a means to tap the IF to feed the SM220 scope. The IF is different but the principle should be the same.

Good luck,

Max

Date: 2007-12-15 12:39:55 UTC
From: Ken Winterling
Topic: 6585 Message: 6586

Sven,

I don't have an 850 at the moment but have worked on several and I offer this caution regarding keying any external load with the internal relay. While I know the FL-2100Z relay keying circuit is approximately +12 VDC at the connector (ground to transmit) I do not know its current draw. I also do not know the current handling specification for the control relay in the TS-850S. I'm sure somebody on this reflector has done more work on these rigs and can provide that information. You do not want to exceed the specifications for the internal relay contacts.

I would put a ma meter across the FL-2100Z relay connector (which would key the amp) and measure the current. If it is only a couple hundred ma I suspect it will be within the capability of the 850's relay. Any more than that and you should use an external keying circuit. It can be a small relay or a transistor; there are many circuits available for the latter. Commercial rig/amplifier interfaces are also available.

Here are the TS-850S remote connector pin assignments:
1: Speaker output
2: Common contact of control relay for keying an amplifier
3: External PTT circuit (ground this pin to transmit)
4: Normally Open (NO) contact of control relay (closed in transmit mode)
5: Normally close (NC) contact of control relay (closed in receive mode)
6: ALC input (0 to -9 VDC) from external RF amplifier
7: + 12 VDC, 10ma MAX, on Transmit
Shell: ground

To key an external amplifier, you would normally ground pin 2, the common contact of the 850's internal relay. Pin 4, the normally open contact, would be connected to the amplifier's relay jack. Usually a shielded cable is used between the two units. The shield would be connected to the shell of the connector; the center conductor is connected to pin 4.

The ALC connection to the amplifier, if used, would be made using a shielded cable with the shield connected to the shell of the connector. Pin 6 would be connected to the center conductor and connected to the amplifier's ALC jack.

You can also use the pin 7 +12 VDC to key an external circuit such as a transistor instead of the internal relay. Just be sure you do not exceed the 10ma maximum. That won't be a problem if you use it to drive the base of an appropriately-sized transistor.

73,

Ken, WA2LBI

6587. Re: TS-850 ATU noise --- and battery questions?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-15 03:11:50 UTC
From: catdjc123
Topic: 6573 Message: 6587

Jeremy,

My 850 is a 61M serial number. My ATU does not make any screaching noises when it tunes. It is fairly quiet other than the mechanical sound of the motors spinning to move the variable caps. I believe the tuner contains two motor driven variable capacitors (VC1 and VC2) and an inductor that has fixed tap points switched by relays, not a roller inductor.

I do not know the answer to your question about any lubrication points within the ATU. I looked in the service manual, but the service manual is silent on this topic as far as I can tell. Maybe someone else in the group has experience with this.

Regarding the battery replacement. I think all 850's are now old enough that replacing the battery is warranted. The fact that your battery is still working is not an indicator that it is not leaking. As an example, my battery was still functional but when I replaced it the battery was beginning to leak and had dripped down on some of the chips that sit below it. I think to not change the battery at this point is risking damage to your rig.

Emne: Re: [TS-850_450_690] TS-850S and FL-2100Z

Sven,

I don't have an 850 at the moment but have worked on several and I
offer this caution regarding keying any external load with the
internal relay. While I know the FL-2100Z relay keying circuit is
approximately +12 VDC at the connector (ground to transmit) I do not
know its current draw. I also do not know the current handling
specification for the control relay in the TS-850S. I'm sure somebody
on this reflector has done more work on these rigs and can provide
that information. You do not want to exceed the specifications for
the internal relay contacts.

I would put a ma meter across the FL-2100Z relay connector (which
would key the amp) and measure the current. If it is only a couple
hundred ma I suspect it will be within the capability of the 850's
relay. Any more than that and you should use an external keying
circuit. It can be a small relay or a transistor; there are many
circuits available for the latter. Commercial rig/amplifier
interfaces are also available.

Here are the TS-850S remote connector pin assignments:
1: Speaker output
2: Common contact of control relay for keying an amplifier
3: External PTT circuit (ground this pin to transmit)
4: Normally Open (NO) contact of control relay (closed in transmit mode)
5: Normally close (NC) contact of control relay (closed in receive mode)
6: ALC input (0 to -9 VDC) from external RF amplifier
7: + 12 VDC, 10ma MAX, on Transmit
Shell: ground

To key an external amplifier, you would normally ground pin 2, the
common contact of the 850's internal relay. Pin 4, the normally open
contact, would be connected to the amplifier's relay jack. Usually a
shielded cable is used between the two units. The shield would be

connected to the shell of the connector; the center conductor is
connected to pin 4.

The ALC connection to the amplifier, if used, would be made using a
shielded cable with the shield connected to the shell of the
connector. Pin 6 would be connected to the center conductor and
connected to the amplifier's ALC jack.

You can also use the pin 7 +12 VDC to key an external circuit such as
a transistor instead of the internal relay. Just be sure you do not
exceed the 10ma maximum. That won't be a problem if you use it to
drive the base of an appropriately--sized transistor.

To avoid the potential of no ground and or bad grounds on an amp causing high voltage on the chassis of the amp Kenwood has separated the amp keying ground from the radio ground.

To key an amp hook the ground side of the amp cable to either pin 2 or 4 and the center to the other.

Am not touching on proper grounding techniques.

Jeremy,

I concur with Dan re the battery replacement. Additionally, I suggest that when you replace the battery, you relocate it as already existing mods have indicated.

73,

Paul / N1FB

catdjc123 <dancrites@...> wrote:
Jeremy,

My 850 is a 61M serial number. My ATU does not make any screaching noises when it tunes. It is fairly quiet other than the mechanical sound of the motors spinning to move the variable caps. I believe the tuner contains two motor driven variable capacitors (VC1 and VC2) and an inductor that has fixed tap points switched by relays, not a roller inductor.

I do not know the answer to your question about any lubrication points within the ATU. I looked in the service manual, but the service manual is silent on this topic as far as I can tell. Maybe someone else in the group has experience with this.

Regarding the battery replacement. I think all 850's are now old enough that replacing the battery is warranted. The fact that your battery is still working is not an indicator that it is not leaking. As an example, my battery was still functional but when I replaced it the battery was beginning to leak and had dripped down on some of the chips that sit below it. I think to not change the battery at this point is risking damage to your rig.

73,

Dan

6591. pc connection to ACC2

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-17 16:41:22 UTC
From: raymond
Topic: 6591 Message: 6591

Let's see if I have this right. From the ACC2 connector pin 3 and 4 are audio output. Pin 11 and 12 are the audio input. The PTT pin is 13.

So all I need to use is 4 pins to this connector, since audio and PTT grounds are common. And if I ground my ts850 case to the PC case I only need 3 pins on the ACC2

Is this right?

I have isolation transformers and a db9 connector and opto couplers to make this all work to a sound card.

And does any body know the diameter of the pins in a 13 pin din connector, I can make my own din if I only use 3 pins.

That is correct Ray. Note there are two PTT lines in the ACC2 jack,
pin 9 and pin 13. One, can't remember which, mutes the front mic input
line when keyed. This is the preferred method so your room noise,
sneezing, coughing, and the other is not picked up by the mic.

Am i correct in assuming that the potentiometer VR7 which is a tiny silver flat surface mount type is the correct one. Located just inside bottom cover for filter access. Just looking at this tiny thing i see no means of adjusting with a tool.

Yes VR7 controls the output power. Why do you need to adjust it? It should not need any adjustment. If adjusted too far the transmitter will go into oscillation. And you will destroy your finals. It should be set for 100W CW output. The station on the other end won't notice any increase the radio is capable of.

I adjusted it to see if I could get the radio from its normal 50 to
70 watts closer to 100 watts SSB. The adjustment didn't seem to make
a difference so I brought it back down.

When you say radio will go into oscillation how would I see this
occur or would I? And would reducing the adjustment of the
potentiometer stop the oscillation.

I have noted that i have a power flux at all power settings when I
transmit a CW carrier or FM and AM Cant tell on SSB. I did not
check this prior to adjustment to see if it fluxed then.

Topic: 6597 Message: 6601

Gene,

When you say 50 or 75 watts or you referring to SSB power or CW or FM carrier power? If you are referring to SSB power you have to measure it on a peak reading meter. The meter on the 850 may or may not be accurate. Best way to check, is put the rig in FM mode and key it or CW and close the key. See what the meter reads. It should be somewhere around 100 watts. On SSB the meter may only go as high as 40 or 50 watts. This is not an indication the radio is lacking output power, simply the meter circuit is not fast enough to keep up with you voice peaks. Turn the peak hold feature on and see what the 850's meter shows. But it is best to measure it on an accurate external watt meter. As far as the oscillation issue, you have to be adjusting VR7 in FM or CW mode. If you turn VR7 too far it will sound like the radio is farting, for lack of a better term and your power will drop. Better to test this on the lower bands. I would set VR7 for 100 watts and leave it. 25 watts either way won't make a difference on the receiving end. there is a power down switch on the RF board just in front of VR7 towards the front of the radio. Make sure it isn't in the 50W position.

73 all and Merry Christmas.

Max

6602. TS-850 band to band output power chynges

Yahoo group: TS-850_450_690 (2006 — 2009)

The compensating circuit is called the Carrier Control. When aligned
properly the gain varies from band to band and the Car Control is
adjusted for midscale ALC as needed. The power should then be whatever
the original setting was except for 10m where it will probably be
slightly less.

6606. TS-690S ATU mod for 160M and/or 6M possible?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-28 18:42:05 UTC
From: aa5te
Topic: 6606 Message: 6606

I've carefully looked over the schematics for the 690S but am at a loss for how to, if it is possible, make the internal ATU work on 6M, or 160M, or both. Anyone know if this can be done? If so, how?

6607. Symptoms of TS-690S oscillation

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-12-28 18:40:12 UTC
From: aa5te
Topic: 6607 Message: 6607

I've noticed something disturbing recently on one of my 690S's only on 6M: when I transmit voice or CW, sometimes the power will jump up to nearly 100W steady state (internal and external meters both indicate the problem, and power supply current jumps as well, so it is real), like it's being continually keyed (it's only rated for 50 or 60W, that's the norm from the factory) and my SWR reading will simultaneously drop to near a perfect match, even if the antenna I'm on isn't at a perfectly matched state. It will do this with three different antennas and the dummy load as well. I have to stop transmitting/unkey, sometimes have to reduce power, in order for this symptom to clear.

I've seen some mods out there for better ALC control in these rigs, and have seen a few people mention oscillation and moving some cables in the radio and installing ferrite beads here and there (and have now done so - ferrite bead and cable moving, without success), but is this really a symptom of oscillation? I would tend to think it is as it jumps high without warning (just like an oscillating op-amp), but would like a second opinion (or third, fourth, etc.).

Tnx

My TS850s recently suffered the failure of the D31 RX switching diode, (original part RLS135)a surface mount component.
Looking at previous posts on this site I understand that a MI204 is a suitable replacement but I have been unable to find a supplier of this diode here in the UK.(unless someone knows otherwise)
Is there another more readily available substitute that can be used or does anyone know a supplier that would be prepaired to ship such a small item to the UK without charging a fortune for carriage?

6615. Replacement diode required

I see that Parts Store have the diode in stock at $3.95 plus $7.45 shipping
within the USA, but no international shipping.
It looks as though you need to find some kind person on the list, in the
USA, willing to purchase one and ship it over to you for a consideration.
What other suppliers have you found?

Hi Tracey
Thanks for the info, I have just sent them an e-mail to see if they will ship to the UK and am awaiting their reply.
So far all my searching has been via the web as most companies have been on holiday for Christmas,but I intend to start making a few phone calls when everyone starts back again. If anything turns up I will post it on here so that others will benefit.

Kenwood parts shows the MI 204 to be discontinued and the replacement is XB15A204 . It is $2.71. You might try them I think they ship overseas or you could look for the replacement over there.

www. kenwoodparts. com remove the spaces.

A google search turned up this message on the QRP website. It looks like the RLS135 is a common 1N914 silicon diode which should be available anywhere.

http://qrp.kd4ab.org/1994/940607/0015.html

Hi
please check

http://www.ges.cz/?page=index&or=sort&ipp=12&lang=en&cur=EUR&gcat=X1DDG&of=1&inc=browse

there is some source for switching PIN diodes in e-shop (after
registration).
There is 13pcs of MI301 already in the stock.

Try to compare parameters and try to order....

73! and HNY!

Cliff, Doyle et al...

I returned from a long absence (18 months) and turned on my TS-850 to
listen to the radio...

Surprise...

I have what appears to me to be similar symptoms to Doyle's.

The "On Air" indicator is lit but not at full brilliance.

The radio does not receive.

The TXB line on the RF board is at 7.9 volts.
The RXB line is at 0 volts.

The rig has only th "clip Diode D11" mod, to open 5 and 10 MHZ.

I have replaced the battery (was still original) with a battery holder
whose pin spacing matched the welded pins of the original battery,
although there is only one Positive pin.

My serial number is 30900353 (TS-850S/AT

I never saw a reply by Doyle about his problem, and wonder where to go
with this.

Most likely;

C1 on the carrier unit has leaked and shorted the 8v line to the TXB
line which runs under it.

Clif, a follow-up...

I opened the CAR unit and carefully checked around it (both sides) and saw no leakage -- but then I didn't remove any components or even connectors when I inspected it. the caps ar3e sitting on little pedastals, and the pedestals are black, and no sign of electrolyte or anything like unto it.

Well, enough for tonight. Reading schematics and pcboard layouts on-line (well,m after downloading the service manual but not printing it out, is a pain.

Thanks again...

For those with inquiring minds...

After replacing the memory keep-alive battery, I reassembled the rig enough for a smoke test. Somewhere along the way, though, the REC/SEND switch had been pressed!

Duh!

Root cause analysis of problem -- short between the headsets!

Thanks,

Dan AA3LS

6627. Palstar SP30 speaker

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-01-03 22:21:18 UTC
From: bigfork04
Topic: 6627 Message: 6627

I purchased a Palstar SP 30 speaker and connected to my TS 850, my volume output through the speaker is very low even when I turn up my TS 850 to full output. Any suggestions? The volume from my TS 850's speaker is very loud. I connected the SP 30 to the rear speaker output with a 1/4 to 1/8 adapter. The SP 30 is 8 ohms

I've no info on the Palstar SP 30 speaker, but offhand guesses are there's a bad connection or the speaker requires more drive than that available. I suggest trying another speaker(s). A few weeks ago, I purchased a pair of bookshelf speakers from RadioShack: the KLH B Pro 6. They were on sale for $20. The rear audio-output jack of my TS-850 drives them both with absolutely no difficulty and with room-filling volume.

Have you tried the SP-30 on anything else? Maybe it is the problem.

Thanks to everyone who replied to my request for a UK supplier of the MI204 diode.
I have now been in touch with Fullers Ltd of Ipswich who are the main UK spares agents and they are able to supply both the original RLS135 diode and the replacement MI204 from stock.
For the benefit of other UK TS850s users their e-mail address is spares@... and their minimum order value is only £5.00 plus postage.
I am now eagerly awaiting the arrival of the postman !!!!!

Best 73's Cyril.

In case you have not checked into this...the 1/8 inch jack on my
TS-850 got very loose. Internal speaker was fine, anything external
was intermittently weak. I got inside and tightened it up - it was a
matter of bending bits of metal. Don't know if Kenwood used a
marginal jack or if these 1/8 inchers are simply built to a low
standard in general, but that's what I ended up doing.

Hi Conrad,

If you are into hi-fi SSB which is available for discussion in many other groups, the DSP100 is a very desirable accessory. In not you could sell it for a nice price as many 850 owners would love to get their hands on one. They typically sell in the $600 range. I would be glad to babysit it for you :)

Conrad:

On receive the DSP-100 Is a very good noise reduction filtering unit for the 850. I have and use both. Personally, I would not use my 850 with out one (dsp-100) as it makes for hours of quiet listening. I also believe that unless you have some good Inrad filters in the 850, the filtering options the '100 offers is very valuable. Transmit audio and signal energy is increased if you use the transmit feature---awesome on an already excellent audio monster transceiver. There are also some 'hidden' features to this unit and the 850 for increasing occupied bandwidth and audio fidelity--not for everyone.

I believe the '100 takes an excellent analog 850, into the digital age as was the 950 sdx, and the following ts-870. I also think you should try it before you outright sell it as you will probably never get the chance to have one again--they are desirable and go for $400-500. Unless you need the $, I would keep it with the 850. I also had an 870 along with the 850/100 combo and felt I had two nearly identical units--I sold the 870.

Just my users opinion.

Hi Conrad,

Try it out for a while and decide if it's an advantage to you. Then if you feel you don't need it or like it, offer it for sale.

I'll bet several people on this group would be interested in it, me included!

I got my TS850 back in December of 2007 it's mfg date is November of 1995. The IC's on the carrier board are dated 1993.

Alas I will replace the caps with chip smd tantalums. I see 10uf 16v caps on ebay for $0.99/20pcs
So I'll order 20 of them and put 5 of them in parallel for the 47 uf.

For anybody doing surface mount work you should have a product called ChipQuik(tm) http://www.chipquik.com/.

From: rwt_wpg
Topic: 6640 Message: 6640

I just received a used TS850 - my first Kenwood. The DC connector that came with it was new, unused in an unmarked bag and is identical to my Icom 718 DC connector. It makes for quite a loose connection even when the Molex connector is snapped in position. Moving the rig just a bit cuts power off/on. I'm thinking it's the wrong connector.

Is the Kenwood TS850 DC connector supposed to be identical to the Icoms?

6641. CW Sidetone Volume

From: Marty Bluhm
Topic: 6641 Message: 6641

After operating a few hours of the NAQP CW test, the volume of the CW sidetone was rattling my cage. I've looked in the manual for adjustment; but cant find one. Also the manual say's there is a front panel adjustment for adjusting the transmit cycle (dropout rate)for full/semi full keying. I cant seem to find these also. Old age setting in.

Can anyone help?

Thanks and 73
Marty

Sounds like someone sent you a Molex connector. A Molex has larger
pins than the power connector used on Japanese radios and will not
work correctly. Look at the ends of the 718 cable and the one for the 850.

Marty,

There is a very simple mod that involves removing a resistor from the IF board and jumpering a small cap in its place. This allows you to use the monitor control on the 850 to control side tone volume. Takes more time to remove the bottom cover than it does to perform the mod. The only other way to adjust it is from inside the radio. On the IF board in the same location near the back you will see the pot for the side tone level.

Topic: 6644 Message: 6644

I've been trying -- without luck -- to locate a source of what I think are called "finishing" or "dress" washers. They're the thin, plated washers that fit between a panel and the mounting nut for a 3/8-inch-diameter CW key jack. I'd like to find not only the standard size, but some that have a bit more shoulder width to cover an existing panel hole. Standard zinc-plated washers are too thick and not attractive.

Does anyone know of a source for such hardware?

Tnx es 73,

Paul / N1FB

Aloha Paul,
Fiurst of all Paul are the filters YK-88cn-1 and YG-455cn-1 or just the older YG-455cn/YK-88cn? If they are the ones mounted on a small board they hence the (-1) they simply plug into the bottom of the radio, there is a door on the bottom of the radio that has a raised aera and 2 screws. If the radio is on it's top the YK-88cn-1 plugs in on the left side of the radio and the YG-455cn-1 plugs in on the right side. If the are not the (-1) filters they do not work as their frequencies are a bit differnt that the (-1). After the filters are installed turn the radio back over and open the little door on top left side of the radio and turn on the swtiches for the 88 & 455 filters. Than it's ready to rock and roll.
Good Luck and DX
Roland AH6RR

MODIFICATION OF THE TS850s MONITOR

(by SM4OTI via packet and from BCC handbook)

Another drawback of the TS850s is that the CW monitor level cannot by modified with the MONI pot on the front panel. Here is how to do it.

Originally the CW level is controlled by VR5 internally and has to be at a fixed level. Using headphones or the loudspeaker makes a big difference, so this modification allows to adjust the CW sidetone with the MONI pot. like for SSB.

1) Remove the IF-UNIT (you must solder on the rear side of the IF-UNIT). Be carefull to mark all the cables before you remove them!!!

NOTE: YOU DO NOT HAVE TO REMOVE THE IF BOARD

2) Remove R239 (330 kohm, close to VR5).

3) Install a new resistor (330 kohm) and a 0.1uF capacitor as described below.

4) Adjust VR5 to maximum audio level.

Drawing from BCC Handbook

Now you're able to adjust your audio level in the CW mode with the "MONI-knob" at the frontpanel of your transeiver.

Pictures in the file section.

6651. IF signal amp ??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-01-16 13:46:49 UTC
From: ve3tmt
Topic: 6651 Message: 6651

Greetings all,

I have obtained a very nice Heathkit HO-10 monitor scope for use with my TS850. I have successfully tapped the 455 IF to monitor receive signals on the scope. The only problem is the signal, with the scopes vertical gain at max, is about one inch high on the display. I would like to build a small IF amp to amplify the signal level to a more appropriate level.

Any suggestions? I am thinking an inline amp between the 850's IF OUT and the scope input.

6653. Anyone use a RigExpert on the TS-850?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-01-17 01:56:44 UTC
From: rwt_wpg
Topic: 6653 Message: 6653

I received a set of cables from RigExpert and connected my TS-850 to my RigExpert S/D. Now with the Acc2 cable plugged in I get a hum on transmit. Anyone else have this problem?

Cheers
Richard

I believe that using AFSK with the TS-850S produces hum in the SSB audio. I had that problem and discovered it is a common one. I solved the problem, back when, by using FSK and I didn't have the hum. Now I am using the TS-870S for sound card modes and I don't have the problem.

Steve, N4JQQ

PS, this link talks about the problem.....

Hi Richard,

The hum is coming from your computer. Unplug the speaker or line out from your computer and key the radio. See if the hum is still there. I'll bet it isn't. If it is I would be suspicious of the cables. I believe the RigExpert audio lines use isolation transformers in the input and output lines. You should not be getting any hum. How were you using the unit before?

Topic: 6656 Message: 6656

I've been using the basic hand mic with my 850...
No problems or anything. I was wanting to replace it with a desk mic or possibly a studio
style on a boom. I know some people swear by the Astatic D104's, the kenwood mc-60's,
the turner sidekicks and even Heil. I've got a D104...and a yeasu md-1. I'm looking for good rich
audio without spending a pile of bucks....any recommendations ?

Yup. The D104 will need some caps to kill the extreme highs and a blocking electrolytic (about 10mfd) in series with the audio lead to prevent shorting the phantom voltage used to excite an electorette mic. I believe about 220 pico farad across the element will kill off the extreme highs.
Personally I would not use the D104. I use a Shure Brothers studio mic on my 450s and it works extremely well. Here again a DC blocking cap must be used in series with the audio lead to block the dc phantom voltage. Should you choose to purchase off Bob Heil, they will have much data on what cable and other peripherals you would need to match your radio. Good luck and 73!

Yuri VE3DZ at RigExpert had me check a couple of the ground pins on the DB25 connector to look for shorted grounds. Sure enough, there was a problem. Eventually I found the metal shell on ACC2 connector was shorting a couple of pins. Fixing that resolved the hum problem.

I did have to adjust VR18 to bring down the transmit level.

Thanks for the help, everyone.

I think you mean "electret" mic. There is no need for any DC blocking capacitor. The DC voltage on the Kenwood mic plug is on pin 5 I believe. It is not imposed on the audio line.

Jon, to answer your question, I have used D104's, cheap mics from Radio Shack, Behringer and Samson studio mics, and Heil mics. Don't waste your time and money on the studio mics or the Heils. If you use a studio condensor mic, you will need a 48V phantom power supply to power it and if you put it right into the radio it will sound like crap. These mics need external equalization. Then you are working with line level signals which will not work well into the mic jack. If you feed the balanced modulator directly it is fine. It you want a light show when you talk then maybe this is the way. But after getting the mic, preamp, equalizer, and any other effects units, and modifying the 850 for direct modulator feed, and the possibility of RF getting into the audio, you will still only be transmitting 2.7 KHz wide.

From my personal experience after experimenting with all these mics, I now use a simple Behringer XM1800 dynamic mic on a boom fed right into the mic jack. This way the VOX still works and with the processor and high boost on it sounds just as good as any of the other mics. I think all that outboard gear is a waste of time and money. I learned the hard way!!

Harley,

Looking at the back of the 850,

(4) (5) (6)

(1) (2) (3)

2 & 5 are ground
3 and 6 are positive
1 and 4 have no contact

73,

Help

No or very low output.

Auto tuner never tunes, always seems to detect very high SWR

Not using the internal tuner, the SWR is very low and very, very low output

back-up rig works fine with identical antenna.

TX seems fine

Thanks

Peter,

Have you checked the CAR level? If it is too low the tuner will not
function.

I don't see why it wouldn't work. On ACC2, pin 3 is the receive audio out from the radio and pin 4 is it's corresponding ground. Pin 11 is the TX audio into the radio from the RigBlaster and Pin 12 is it's ground. Pin 9 or pin 13 will key the radio when grounded. If you check your manual, grounding one of them mutes the mic line from the front of the radio. This will prevent any of the noises in your shack being transmitted with the digital mode audio.

Hi,
Just installed now the YK-88 CN -1 and the YG-455C -1 CW filters. I installed the YK-88 CN-1 in the option filter 1 (rig facing to me , the second place from the left) and the YG-455C-1 at the right. The question is about the switching board at the top of the TS-850 ?
I make the switches like this :-
ON ALPS
1 2 3 4
↓ ↑ ↓ ↑
off on off on

Now I have the 500 lights on under the 8.83 and 455.
Can someone please tell me if I make them good ??
Thanks and 73's

Check item # 120207839080 bidding ended on the 12th. Last few I've seen on eBay went for similar prices. There was a broken but sold as repairable one that went for over $300.00 a month or so ago.

I installed the YK-88 CN-1 in the option filter 1 (rig facing to me ,
the second place from the left) and the YG-455C-1 at the right. The
question is about the switching board at the top of the TS-850 ?

Paul,

I believe you should have the two switches at either end in the on
position. The switch closest to the front of the radio activates the
YG-455 filter and the switch closest to the back activates the YK-88CN
filter. The switch second from the front has no effect and the 3rd
switch is for the YK-88C filter (500 hz)

Hi All

On my TS-450SAT, it just started not letting me go downward from band to band below 14.094.40.

It goes OK from 10 to 12, to 15, 17, 20 on 14.094.40, but then it won't go any farther down. If I tune the VFO up to, say, 14.200, then hit down, it goes back to 14.094.40. It goes up frequency fine.

This is on VFO 'A'. On VFO 'B' it works normally. 73

Back in the old days in the navy (iron men and wooden ships) we had to do something that today would be called "root cause analysis" of failing radios, etc. Perhaps THE most common was a code which could best be interpreted as "short circuit between the headphones" ;-))

I had a problem a couple weeks ago that sounded like the fruits of leaky capacitors, and all sorts of other stuff... but while I was installing the new keep-alive battery, I'd accidently set the radio into transmit mode by pushing the Send/Receive button in. Three days later, it was a really cheap fix!

Clif tried to help me with this one, too, but because he didn't look at my radio, he didn't see the switch was activated!

Often, asking "WHY" is fruitless, but I'll agree with Max - if you've never replaced the keep-alive battery, it may well be time.

Subject: filters

Hi,
Just installed now the YK-88 CN -1 and the YG-455C -1 CW filters. I installed the YK-88 CN-1 in the option filter 1 (rig facing to me , the second place from the left) and the YG-455C-1 at the right. The question is about the switching board at the top of the TS-850 ?
I make the switches like this :-
ON ALPS
1 2 3 4
↓ ↑ ↓ ↑
off on off on

Now I have the 500 lights on under the 8.83 and 455.
Can someone please tell me if I make them good ??
Thanks and 73's
9H1SP
Paul

Hi Dan

You are right, but it doesn't hurt to ask.

Most problems are problems that others have seen, and why spend hours trying to track down something when the answer is as simple as "do a reset."

Now, next time something happens squirrely, I will know what is the first thing to try--"do a reset."

I had never seen that before, but bet Clif has lots of times. 73

Hello all. The antenna tuner in my TS450S seems to make the swr higher instead of lowering it. On 80 meters, the swr is about 1.5 : 1 without the tuner and 3.8 : 1 using the tuner. This is with an 80 meter dipole. I can hear it operate and stop so it is doing something. Anyone know what the problem might be? thanks Jim

r u using an external swr meter when using the internal atu in radio the external swr meter shows higher swr than swr meter on radio this is normal if this is the case
usually i have all my antennas resonant for each band and never use tuner
u cant beat a resonant antenna im just lucky i have lots of space for large antennas
hope this helps

I am using only the ATU in the TS450S. My antenna is resonant from 3.800 to 3.900 and the swr is low (<1.8 : 1) and the power output is high (about 100 watts)according to the TS450S meter. When I tune to 3.700 the SWR goes up and turning on the ATU does not bring it down at all. The same thing is true on 160, the antenna is resonant for about 50 khz, but the ATU will not lower the SWR outside of the resonant range. thanks Jim

Jim,

The ATU in the TS-450SAT does not function on 160 meters. It only works on the 80M though 10M bands.

According to the manual, the ATU unit is capable of matching an approximately 3:1 SWR. Have you checked the SWR of your antenna at 3.700?

Be careful about using your antenna tuner with an antenna that is signfiicantly out of resonance. 75/80 meters comes to mind. A friend of mine used my TS-450S for a CW contest in C6 and burned the tuner completely up using a non-resonant antenna. I like to use my antenna to match the rig to the amp. I let the Drake MN-2700 do the heavy work.

For such a simple mod, makes me wonder why it wasn't incorporated into the 850 in the first place.

Okay, I have a 20 meter J- pole that has a less then 2 : 1 swr over the band center and about 2.5 : 1 at the cw end. When I switch in the tuner, the swr goes up to about 8 : 1. It's like the tuner operates in reverse LoL. Jim

Hi Jim,

Where is your output power set? The auto tuner doesn't work well if
you're running less than about 10 watts out.

The tuner in my 850 will tune ALMOST anything on all bands including 160.
It has a tough time on 160 with really short verticals. Won't do
bedsprings on that band either.
:-)

The ATU pcb arcs out from the tune coil end feed lead connection to adjacent pcb track that is too close. Easy fix by connect end feed lead direct to coil instead of via pcb. the problem never re-occurred in five ts-850s units I carried out this procedure on. VK4TUX

r u guys checking swr on radio swr meter or external meter ???
internal atu tuners in radios are ok and tune most but some dont better with resonant or nearly resonant ant or an external atu i only use tuner like other guy steve says to match linear to radio and external atu if needed to tune ant a resonant ant makes a whole lot of diffrence
regards and great group

I am running about 100 watts according to the meter on the radio. It drops down to about 20 watts when the ATU is engaged. I am going to open the radio and check out what VK4TUX mentioned regarding an arcing problem. I will likely be buying an external tuner also so I can match a wide variety of antennas. thanks Jim

Just a thought but after you put the tuner inline you are pushing the
"tune" button, correct?

Ok Jim you will see the end on the tapped tune coil at right of ATU PCB and the end closest to radio fromt. the lead goes into the pcb to a short track to the coil end.

I removed the coil end and twist the coil 90 deg so the end sits up in the air above the pcn. the other coil taps still support the coil fine. Then connect the lead direct(solder) to coil end. The damaged peice on pcb should still be cleaned up and check the ground track (close to original lead supply track) is intact and not burnt open circuit.

I consider it a design flaw, and have had a few debates in years past on this forum. Hams I have repaired for, went back to the same antenna and ATU tuned, with no further problem. IE; the ATU was well within its tuning range, but the voltage insulation properties weren't due to the pcb design, with 1/16" pcb track separation for full voltdrop adjacent is ridiculous..

VK4TUX

I have not done the cw sidetone mod yet but have a question as to what the end results are. When all is said and done, is my assumption that the 'Moni' control will vary BOTH (either) the cw sidetone and/or SSB monitor volume correct or do we loose control of the SSB moni volume?

Tnx es 73 de

You are right the first time Mike, the mod allows you to control both
the SSB and FSK signal volumes as well as the sidetone level in CW
mode. Don't hesitate, you will be glad you did.

Since it isn't happening on all bands equally I would rule the DC-DC converter out. I wonder if perhaps there is a leaky switching diode.

yes been thinkin that but funny as the alc is still endstop when no audio is on
and pwr on lowerbands is very hi 150+ even when pwr nob at 0 micgain is doing the work
i think tis 1 is haunted its a lowband only lol all in all it does crack out on 40 80 160
gud reports suppose i have to do some more disectioning lol tnx

It probably has shorted diodes in the BPF on the RF unit. Someone
turned up the power to try and get more on the higher bands.

Unless you like replacing finals I suggest you start by turning the
power down per the service manual.

Anyone know the orig retail price of the 850 when it was being sold new?

Interested in 1994-95 time frame or anytime someone might remember.

Thanks
Jim

According to the 1991 QST product review...

TS850S with MC43 hand mic $1699.95
AT-850 internal tuner $205.95
YK-88SN-1 1.8 KHz SSB filter $84.95
YK-88C-1 500 Hz CW filter $98.95
YK-88CN-1 270 Hz CW filter $84.95
YG-455C-1 500 Hz CW filter $149.95
YG-455CN-1 250 Hz CW filter $159.95
YK-88A-1 6 KHz AM filter $88.95
DRU-2 digital recorder $121.95
DSP-100 DSP unit $629.95
SO-2 high stability osc. $149.95

I have posted the QST review in the files section in the manuals folder.

73,
Max

Well, I opened up the ATU, did the suggested mod and no change. The ATU still operates in reverse. I did notice the operation of the unit and it definitely functions, just incorrectly. My solution was to buy a used Dentron 1 KW super tuner. Thanks all. Jim

Is this an AT you added on your own? I had a similar problem when I added an AT to my TS-450. There is a diode that you need to remove or clip an end off of. If you don't do that the AT will be all confused. Details for what to do were in my TS-450's owner manual.

That sounds interesting Kurt. The tuner was in the rig when I bought it used from a silent key's estate. The radio is labeled TS450S not SAT so the tuner may have been added afterwards. Actually the original owner was blind so someone else must have done it for him. I will read the manual when I get home. Thanks Jim

It's not a diode, it's a jumper wire. It connects the tuner I/O jacks
together when the tuner is not installed.

My TS-850SAT is labeled TS-850S. Is there a TS-450SAT label??? W8YS

That sounds interesting Kurt. The tuner was in the rig when I bought
it used from a silent key's estate. The radio is labeled TS450S not
SAT so the tuner may have been added afterwards. Actually the
original owner was blind so someone else must have done it for him. I
will read the manual when I get home. Thanks Jim

I added an AT to my TS-450. There is a diode that you need to remove
or clip an end off of. If you don't do that the AT will be all
confused. Details for what to do were in my TS-450's owner manual.

I have a TS-690S/AT, TS-450S/AT and TS-850S/AT. They all say 690S, 450S
and 850S. No "AT" on the front panel. This has come up before. Hope
it helps.

Regards,

Steve, N4JQQ

I don't think the rig itself says "SAT". My 850 right in fromt of my nose
now says "TS-850S" on it and it is definitely the SAT with the original
built-in tuner.

Hi Zack
I have 2 '450's here and both say "S", not "SAT", and both have tuners in them 73

Topic: 6687 Message: 6726

I've owned five 850's, all with internal tuners. They never came from the factory marked TS850S/AT. I did own a coupe of Yaesu FT900's with internal tuners, and although the shipping box said FT900CAT, "C" meaning Collins filter, "AT" meaning with tuner, the radios still were only identified as FT900's.

Hopefully we have resolved this issue.

Okay, so much for me being a source of knowledge about the TS-450S
LoL. I read the ATU installation procedure and unfortunately the
diode was cut as described in the manual. Maybe I will send the rig
out to a shop to have them check it out / tune it up depending on the
cost. Then again I might not and just use the Dentron antenna tuner
instead. Jim

is it possible to reverse the "leads" from the tuner to the radio. I remeber putting coax on the wrong antenna connections on a swr meter. forward and reflected were reversed

Very true Dave,

After performing the RX antenna tuner mod on one of my 850's, the tuner would just go round and round. It would achieve a low SWR but not stop tuning. Just on a hunch I reversed the leads to the tuner. Solved the problem completely.

6730. For your consideration a Kenwood TS-850SAT In great condition

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-02-10 19:10:20 UTC
From: arby7115805
Topic: 6730 Message: 6730

For sale or trade. I am looking for a working combo older HF Rig and HF amplifier set in trade or I will sell this 850SAT for $750 + $35 shipping.
The 850SAT come with the original manual, a copy of the service manual, a CD with copies of manuals and other 850 downloads all of them in a nice looseleaf notebook. It has the original hand mic and DC power cord. Does not have original box but will be double boxed for shipping.
The radio functions on TX & RX and works up or better than factory spec's!! The antenna tuner works flawlessly and the radio is in good cosmetic condition too.

Pictures upon request email me at

kd6rhr at msn dot com

Thanks for your interest
Steven

6731. TS-450 won't key up

Yahoo group: TS-850_450_690 (2006 — 2009)

From: Tom Osborne
Topic: 6731 Message: 6731

HI All

My TS-450SAT has quit keying up again. It acts like it keys--it mutes the rx, but doesn't key the transmitter.

I did the factory reset and set the menu 19 to 'transmitter on' but it still won't key.

The antenna tuner won't tune either. The light click on for a second and goes off.

I thoght it might be the battery, but according to the manual, all the battery does is keep the memory alive. It says it doens't have anything to do with the operation of the radio.

I checked the cables and plugs and didn't find anything out of whack there.

Tom,

Is the red TX LED lighting up when you key the radio?

Check the TXB voltage coming off the TRX board. It is a small vertical soldered in board on the IF board. You should get 8V on the TXB pad in transmit and 0V on the RXB. In receive the readings should be reversed. You can also find solder pads on the IF board labeled TXB and RXB. You can take your measurements there.

1. When I enter the service mode (AIP+XIT+SCAN) my radio does not display Fd1E, is this a problem?

2. When I enter the service mode and rotate the M.CH/VFO CH to 03 and then use the up/down to scroll through the different memory channels do I need to depress another key to select that channel? The unit that I have stays at the frequency when I turned it off.

73,

Now that's a good question!

Sorry I left out that information; it is for a TS-450SAT.

If your reading this thanks for your patience.

Still have a question about the digital word when entering service
manual, the manual says, Fd1E, mine says 862d. Is this am issue?

Next question, the manual indicates that AM max power is 40W. If this an automatic setting, or does it need to be set using the power and carrier controls?

Final question, the auto antenna tuner works OK, but when making a large change in frequency the power seems to drop and the auto tuner does not exit the tuning cycle. Suggestions?

I did manage to get the service manual channels (read the &*&* instuctions) and reset VR15 (IF board) and VR1 (filter board) to set the max power. This is the extent of the adjustments that I have made. Otherwise, the rig seems to be functioning as a ham radio. A little suspicious when I turned it on and the frequency display indicated 27MHz.....

73,

Carl - W9PMZ

Still have a question about the digital word when entering service
manual, the manual says, Fd1E, mine says 862d. Is this am issue?

I believe this is the CHECKSUM ROM number and probably there are many
versions out there. This is an internal programming number probably
used by the Kenwood techs and can't be changed.

Next question, the manual indicates that AM max power is 40W. If
this an automatic setting, or does it need to be set using the power
and carrier controls?

YES YES YES. The 450 will put out 100W on AM. As per the manuals
instructions, the PWR control should be set for maximum and then
adjust the CAR level for 25W. Do not set it for 40W.

Final question, the auto antenna tuner works OK, but when making a
large change in frequency the power seems to drop and the auto tuner
does not exit the tuning cycle. Suggestions?

Make sure your CAR level is high enough. If the CAR level is too low,
the tuner will not stop.

I did manage to get the service manual channels (read the &*&*
instructions) and reset VR15 (IF board) and VR1 (filter board) to set
the max power. This is the extent of the adjustments that I have
made. Otherwise, the rig seems to be functioning as a ham radio. A
little suspicious when I turned it on and the frequency display
indicated 27MHz...........

Was the power out low to begin with? Do not set it for more than 100W
out on CW. Any extra you can squeeze out of it will not be noticeable
on the other end and you risk damaging the radio.

What could cause the following problematic symptoms with my TS-850S-AT?

When TX in CW mode, no/low power out on 28, 21, and 14 MHz.

(Other modes not tested but does put full power out on 7, 3.5, and 1.8 MHz.
No other problematic symptoms detected.)

mmm does the radio do any pwr on ssb on these bands ??
my 850 has same prob but on all modes
further investigating a working 850s when u go to topband then press up band to 10m u hear 7 relay clicks i only have 6 relay prob??
also i noticed that i have no att when atenuator is pressed sigs dissapear

there is quite a bit of info on this prob in the archives if u look and most point to leaky diode (s) on the rf board
hpe this can help

Before you start more complicated troubleshooting, check your carier control setting. Make sure it is deflecting in the ALC range when you transmit and adjust accordingly and check the power control setting as well.

6742. RF/IF alignment on the 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-02-23 05:35:55 UTC
From: kdrosenlund
Topic: 6742 Message: 6742

Hi everyone,

I recently hooked up my previous rig to the 850,
my Kenwood TS-680, and noticed something unusual.

Comparing radios, the RF/IF section in the 680 was giving
stronger signals. I could tell by the amount of quieting, plus the S reading
and volume setting.

Maybe I should touch up the RF and IF alignment, if I could I thought.
I have done this on other rigs, but there is some
equipment I don't have.

I do have a nice old Heathkit tube signal generator
that becomes pretty stable after an hour.
I have a RadioShack PC interface DMM,
as well as a freq. counter from them.
There's no scope or spectrum analyzer.

I suppose I can do adjustment 11.
In particular, adjustment 11-1, VR-17.
It says 'set prior to level dropping'. What does that mean?

I'm assuming I can't do adjustments 6, 7, 8-1 or 8-2 since I don't
have the equipment.

Any advice for a cheapskate twiddler is appreciated.

-Kit

If your 680 is receiving better than your 850 the 850 has a problem
and I'm 99% certain alignment won't cure it. The s-meter circuit in
the 850 is a bear to get right with the correct equipment, please
don't try with an uncalibrated signal generator.

The DMM should be the only piece of equipment you need to check the
most common problems which is leaky diodes in the BPF or a shorted
attenuator transistor in the front end.

Do you have the service manuals with the board layouts?

Clif

Hi,

Yes I do have the service manual. I know s-meters can be off
and I don't care if it's super accurate.

The signals aren't TONS lower than the 680, but I should
think the 850 to have a much better front end, and the sound should
be pretty much thundering out the speaker with S9 +30 and the volume at 50%,
as it is in the TS-680.

Thanks and 73s,
Kit

Hi

I`m a new on the list and a fresh user of ts850.
Could anyone have some expirience about replacing a rotary encoder (main tuning dial- not the memory encoder) in ts850?
I buy my ts850 as used equipment and the encoder itself is not in a top notch condition.
I find only

Discont. W02-0855-05 ENCODER TS-950SD*USE ALTERNATE*
W02-1836-15 $51.03

From http://www.kenwoodparts.com/

It says this is TS950SD encoder.Is it equal to the original ts850 encoder? (original part number W02-0855-05)
Our local (polish) dealer of kenwood don`t bother about models below TS 570 :)

Not mine, but check out ad # 645670 on www.swap.qth.com

This filter swaps nicely with the stock 2.7 filter in the 850. Opens up the audio a little. Or will work wonders in your TS570.

Jordan,

I'm sure someone in the group will have an answer for the display. It has been brought up many times. As for the "dots" you may have a VCO that needs realigning. Do you have the service manual?

Hi,
I'm new to HAM radio so my questions may be kind of dumb. I got a
TS-450S/AT, till now very very very happy with it.
Thing is I want to start working digital modes, I get the interface
let's you control your rig with the PC but can you work digital modes
with it?
I've seen cables for that purpose on sale but if possible I'd like to
make it not buy it.
Something else, I see that the connection is to a TS-850 ACC1. My
connector is an ACC2, so I'd like to suppose it's all the same and
just connect it to the equivalent PINS... but you never know and I
don't want to burn my Radio since I have the tendency to burn and blow
things up.
thx,
XE1YAA

6758. TS-440 Question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-02-28 16:40:23 UTC
From: caludaj@charter.net
Topic: 6758 Message: 6758

I realize that this is a TS-690/850 Group but since I am a member of this group I thought I would try it here first.
I need to know from someone who has experience with a TS-440 if there is an easy way to tell if the rig has the antenna tuner installed?
Can you pull the cover and see it easily?
I inherited a 440 from an estate and am trying to determine if it has the tuner installed as the box says only TS-440s and has no "AT" on the box.
Thanks
Joe AA5HP

Look in the cooling slots on the back right top. If you see something
it has a tuner, if there's empty space it doesn't. Or pick it up with
2 hands, one on each side, if it's balanced it has the tuner, if it's
heavy to the left it doesn't.

I took the cover off and there is no empty slot in front of the antenna connector all the way up to the front of the radio so I guess it must have the automatic tuner installed.
Thanks

Date: 2008-02-28 18:00:05 UTC
From: bigfork04
Topic: 6761 Message: 6761

I have a TS-850SAT forsale. It has the 2.7 and 500 khz filters installed. I have no problems with this radio. I just received my new K3 and will not need the TS 850. Comes with hand mic orginal boxes, user manual and repair manual. Cost $725.00 Plus $35.00 shipping. I will pick up the rest of the shipping cost as I am located in Alaska.

Or you could try tuning an antenna as per the manual. If the SWR meter changes and you hear little motors going, it has a tuner.

digital modes are via sound card interface, not rig interface. the only thing your rig interface can do for you, would be key the rig, if the sound card interface does not....

Subject: [TS-850_450_690] Re: TS-450SAT CAT Interface.

Hi,
I'm new to HAM radio so my questions may be kind of dumb. I got a TS-450S/AT, till now very very very happy with it.
Thing is I want to start working digital modes, I get the interface let's you control your rig with the PC but can you work digital modes with it?
I've seen cables for that purpose on sale but if possible I'd like to make it not buy it.
Something else, I see that the connection is to a TS-850 ACC1. My connector is an ACC2, so I'd like to suppose it's all the same and just connect it to the equivalent PINS... but you never know and I don't want to burn my Radio since I have the tendency to burn and blow things up.
thx,
XE1YAA

I realize that this is a TS-690/850 Group but since I am a member of this group I thought I would try it here first.
I need to know from someone who has experience with a TS-440 if there is an easy way to tell if the rig has the antenna tuner installed?
Can you pull the cover and see it easily?
I inherited a 440 from an estate and am trying to determine if it has the tuner installed as the box says only TS-440s and has no "AT" on the box.
Thanks

Hi Joe

Can't you just push the 'tune' button and see if you hear anything going on?
When I push the 'tune' button on my '450SAT, it makes all sorts of racket.

Date: 2008-02-29 22:44:32 UTC
From: Jordan
Topic: 6767 Message: 6767

Hi...I have a Tech Special 850S here, and need some experienced advice....

The rig is dead from 7.5 to 14.499, with the .... etc display....

The "Select" line trace for that VCO is burned open , but all the components check out alright, and there are no hidden shorts anywhere...

The switching transistor Q6 for this line is also fine.

Could this have occurred due to a short on the digital board...?

It appears that the battery leaked at some point , and there are several jumpers installed and re-tinned traces, of which I wasn't told about prior to picking the rig up.....

Has anyone run across this problem...? 73...Jordan.....

6768. TS450Sat VOX stopped working

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-01 15:17:45 UTC
From: Gary
Topic: 6768 Message: 6768

Greetings All: I have had many good years from my rig and then this morning I went to work a little CW and she would not key the TX. I get the sidetone but no output. The VOX on SSB will not work either. I can get output in CW with the send/rx switch pushed on. I get normal SSB operation in PTT mode. I hope this is something someone has seen before.

I also scanned through some old posts and see much info on battery replacement. I can not think of when or ever this may have been done in my rig. What symptoms or problems arrise when the leaky or dead battery problem becomes apparent and requires attention.
Thanks All
All the Best
Gary/W9FNB

battery is only for memory channel backup....

I would check your gain for the vox, antivox, does it have a 'send' button , does it work

Jordan,

First off you will have to make sure that whatever "fixes" were made to the board were done properly. If all appears okay, check the voltages for VCO2 as follows:

On the PLL board, hook a digital volt meter between TP1 and ground and tune the radio to 7.500.00 MHz. The voltage at TP1 should be 2.3V plus or minus .03V, so anywhere from 2.27 to 2.33V is acceptable. If it is not reading in this range, adjust TC2 on the PLL board until an acceptable reading is obtained. Then tune the rig to 14.999.99. The voltage should now read somewhere between 6.0 to 8.0V.

Let us know how you make out.

6772. TS-850S/at repairs Pt. 1

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-03 03:21:56 UTC
From: Jordan
Topic: 6772 Message: 6772

This "Tech Special" was received with far more problems than I was originally informed of...

I had been told there was an intermittent PLL problem, and that on occasion it would display ..... and there seemed to be a problem in the VCO for that range.

Actually , the problem began prior to the VCO problem...
The original(?) battery had leaked on the digital board, and had eaten up several traces, which someone had tried to repair, but had done a very poor job all around. In fact, the replacement battery was found in the bottom of the rig floating around...!

I had to clean up the board , trace and jumper multiple points, test probably 40 circuit traces, then finally when I was happy with the results, I laid down 4 thin coats of conformal coating to protect the repaired lines... It still looks 'ugly' , but it's much better than it was....

Then I got to work on the PLL board, which had actually been worked on in much the same way as the digital board....At least as far as the VCO-B circuitry....Something had caused a trace to burn, but everything in the circuit checked out fine, so I repaired the trace, and replaced the trimmer cap for that VCO with what I had on hand, replaced the board and tested again.... Still no-go with the VCO...Reasoning the problem through, I checked the 8V lines for each VCO, and found that the resting voltage for VCO-B was around 5.5V instead of the 7.9V the others checked out at, So I went back to the active devices thinking one of them had to be leaking....and as it turned out, someone had removed D4 , and put in backwards...!

The diode was removed, and checked out of circuit, and re-installed in the right direction...! A quick re-install shows VCO-B up and running now, the PLL locks up just fine, but I'll go through a proper alignment tomorrow...
I'll add some pictures as well....

I suspect that the battery leakage and subsequent corrosion on the Digital caused a short, which, in turn, burned the trace on the PLL board.

Then someone with 2 left hands decided to try his luck at repairing it.

All's well that ends well..! 73...Jordan...

I can't think of a way in the world that a bad trace in the digital unit can cause a burned trace in the PLL unit. Think about it.

What I have found in several 850's is a screw in the wrong spot. Some of the screws are longer than others and if put in the wrong hole can cause a short and burn traces. The fan screws come to mind although they won't affect the PLL but they cause havoc with the RF and IF boards. Just a thought.

Hi Clif... actually, I don't think it's from a bad trace, I think it's from a short either across the battery edges itself, (the battery was not properly installed) or a short in one or more of the traces... Several of the Dig Bd traces are part of the circuitry for VCO selection....
I can't see the short being in the VCO-B circuitry on the PLL board, as the components all test fine, and there is only the single burn in the trace, which was in the 8V line to VCO-B....

I don't think the diode being reversed could have burned the trace, but anything is possible in a multiple problem rig like this....73....Jordan....

Hey Guys,
I need to find a good quick Kenwood Service Center that will be able to fix my TS-440.
It will not power up at all.
Is there an internal fuse or Diode that might have opened up that I can check?
Thanks in advance for the recommendations.

Joe,

First thing to do is rule out the power supply. Have you tried it with another radio? Have you tried the 440 on another supply or 12V battery?

I once had the same thing happen to my 850. Thought the 850 had a dead short somewhere in the radio. I was all set to sell the radio as-is until I tried it on a car battery. The radio worked just fine. I assumed it was the radio because the supply was showing the proper voltage, however as soon as it was hooked up to the radio the current draw from the final amp transistors caused it to shut down.

Rule out the power source before the radio, it's cheaper to replace!

Max

I may be trying to reinvent the wheel here but I am looking to interface my TS-850 with my computer. I would like to have displayed the Band,frequency,time and possibly a spectrum display of the band I am working. I had heard this can be done but have only seen it work with an Icom 746. I love my 850 and really would like to have the interface feature without haveing to buy an Icom.
Has anyone done what I am trying to do? Thanks for any help.

Hi,

It surely can be done. You can build your own RS-232 to TTL converter
or you can use a commercial one. I use Linux and Hamlib and the
programs that use that like Xlog. It works well.

73,

I put a VOM across the power supply and it shows 13.8 volts (Astron RSM 35) what I am going to do before I ship the thing off for repair is plug it in to the back of the 440 and check voltage across the pins on the inside of the radio.
If it is getting voltage all the way to the inside then something is wrong.

kenwood sells an interface (if you can find them) there are also several aftermarket ones, build your own or ready built.

as far as seeing everything you ask, not sure about spectrum display, but certainly band/mode... take a look at ham radio deluxe, most logging programs, ve3mis??? has a program specific for the 850.. try google search.

Hi

Go to eBay and search for 'G4ZLP'. He makes a great cable that plugs from the radio to the computer. I have 3 of them here--2 for my TS-450SAT's and one for my Yaesu.

I use it with N1MM Logger and Ham Radio Deluxe.

They are very reasonable. Think I paid about $30, shipped. Took 6 days from the U.K. to Oregon. He really stands behind his product, too. 73

G4ZLP's E-Bay note for the Kenwood interface talks about 790s and 850s possibly needing two ICs -- as part of

" The TS50, TS60, TS690, TS790 TS850 and TS960 require the IF10-D. It seems that the vast majority of TS450s and TS850s have these prefitted."

Basically a pair of ICs to be added to the radio.

I thought I understood my TS-850 SAT and TS-790 already had everything but the interface cable/level converter which he sells.

Any comments?

Aloha Dan,
All the 850's and 450's have everything installed just plug in the interface and go.

Hi, Dan:

I have both a TS-690 and TS-790, and they didn't need anything beyond
the external interface (I use the one made by Piexx)

73,

Two of G4ZLP's interfaces are en-route. Thanks for the comments and pointers. Next is either a second RS232 port or a RS232 to USB converter. (another idea is a switch between the two interfaces, but I plan to use both simultaneously at times)

You're measuring R24,25 (100k each). The surge suppressor should be infinite. Best way is look at it. It should be clear and the element inside should be a uniform color. Any discoloration of the element or mirroring of the glass indicates it has been working. Might be time to replace.

I'm watching this thread as my 850 does the same thing. Drops from 22
to 23.5 MHz or so then gradually comes back up. 12m reception is fine.
On a quiet day with no signal there is no s-meter showing on the
radio, but on 24 MHz I usually get about an s-3 noise level.

Well.... Just out of curiousity, and while I was looking for an online source for the 3SK131 FET for the 22-30 Mhz, I thought I'd try the same test on my TS-450S as I was performing on my TS-850S. and much to my surprise,(at first) they exhibit the same characteristic when switching to the High band preamp.
The 450S switches at 21.500 Mhz, the 850S at 22.000 Mhz.

Both radios drop off in "apparent" gain, but because the high-band pre-amps have such a low noise figure, they are perhaps even more sensitive above 22 Mhz than below, which would take advantage of the lower general noise level as you approach 30Mhz (or that's how it used to be anyway...!).

In fact, on both radios you can see for yourself, that the S/N ratio goes DOWN when you use the AIP function above the switching point.

It's a strange result, and you should try it to see what I mean... at 21.999 (or 21.499 Mhz) turn the AIP OFF , then ON and verify that the noise level goes down with the AIP ON.

It's simplified on the 450, as it has a front panel level meter with a 30+dB range and makes weak signal S/N testing and some alignment details very easy to perform.

I'm talking about a terminated in 50 ohm noise level right now, and I'll comment again when I can compare the 2 radios more closely. They seem to be much more similiar than I originally thought.

For now, I'm going to assume the 850 is working properly, at least in the receive section... 73...Jordan....

Hi Jordan,

I recall my FT920 doing exactly the same thing, and I believe that radio also incorporates separate RF amp transistors for the higher bands, although on the FT920 you could select by menu which amp you wanted to use for which band.

Thanks for the info.

"Supposedly" the commands are consist across models. The TS-2000 manual
show an AC command to deal with internal tuner. Below - semi-colon denoted
end of command.

Read is AC;

Set is AC P1 P2 P3; where
P1 - 0=RX-AT Thru and 1=RX-AT In
P2 - 0=TX-AT Thru and 1-TX-AT In
P3 - 0=Stop Tuning(set) or Tuning is stopped(answer) 1=Start
tuning(set) or Tuning is active(answer)
2=Tuning cannot be completed

Answer is AC P1 P2 P3;

Hope this helps

Hi Ron,

Saw that in the TS2000 manual. Both the TS870 and TS2000 have menu settings to enable the tuner in receive mode. Although I have modded my 850 to do so, I wonder if the commands are specific to those models. Still not sure how to activate the tuner. For example if I send the following:

CATCMD:FA00070000;

The rig switches to 7 Mhz. Not sure about the "P" parameters in the tuner line though and how to incorporate them into a CMD line.

Topic: 6799 Message: 6803

Hi Max,

I don't have CAT interface to my 850 yet so can't try this out. Probably easiest way to tell if the 850 accepts the command is to send -

CATCMD:AC;

If it is accepted and you get a response, AC command works on 850. If it is rejected, you know that 850 doesn't support it.

If it accepts it, think the string to activate tuner would be

CATCMD:AC011;

Which would set tuner to auto, then start tune. Assume once it finished it would send you an AC010 if it completed or an AC012 if it couldn't find a match.

Since the 850 did not originally have RX tune, guess it's possible that the command only has 2 parameters, one to switch between thru and auto, and second parameter to start, stop tuner.

Wish I could be of more help. Also wish it was standard across manufacturers - both on commands and capabilities.

I have been asked to dispose of a SK's estate. I thought I would give this group first shot at this part of it.

Kenwood TS850SAT SN 30100xxx It has the VS-2 Voice Synthesizer and the DRU-2 Digital Recording unit. I checked the battery for leakage and all is good. It comes with the stock hand mike, power cord, and W7FG copy of owners manual. It works fine. Non-Smoker Asking $750 plus ship, no original box.

Kenwood PS-52 Power Supply SN 511000xx This is the matching supply for the TS850 Asking $125 plus ship, no original box

Kenwood SP950, sorta matches the 850 Has 2 inputs and line out plus headphone jack. It has 2 High Filters and 1 Low. $100 plus ship

Kenwood YK88SN-1 Plug-in narrow SSB filter $75

Kenwood YK88C-1 Plug-in 500hz CW filter $75

All are in good shape. They are not like new but no scratches, dents, dings, etc, and the paint is good. As I said Non-Smoker. I can take pictures if needed. And no the next stop is not the auction site, I don't do business with them.

Have you checked the bias setting in the 6m final? I had a same type of situation on the 850 where the RF output had been turned up too high causing the final amplifier to go into oscillation. Kind of sounded like a low rumble with the symptoms you described. Turning the power back to normal ceased it. Just a suggestion.

Hey John,

Like the new callsign...

There's are a few voltage challenged (underrated, or right at their
limits) capacitors on 1 or more boards. I believe they've lead to
premature problems or failures.

Cliff and/or others will know the particulars.

I love my mint, late model TS-850Sat! It's still one of the best rigs
ever produced.

Peter,

I assume the CAR and PWR control are at max?

Silly question but some people don't realize the tuner needs a certain power level to operate.

If okay, we'll go from there.

6821. ts850sat auto tuner on 160m

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-15 13:09:03 UTC
From: raymond
Topic: 6821 Message: 6821

I'm using a 100ft dipole fed with balanced line. I was told balanced line is the best so to put that theory to the test I use twisted pair.

The dipole is made from cat 3 cable 3 pair. So six 24AWG wires in parallel. I use the same cat 3 wire for the feed line. Three pairs in parallel.
Attached directly to the dipole by soldering the wires. And to the ts850 thru 17 turns of this cat 3 cable on a F240 toroid with an hf mix as a 1:1 balun with a so239 right into a 3ft rg8x jumper at the ts850's so239.

Now I am told by a local ham that he used to make a living selling TS850's at Michigan Radio, and that the ts850sat had a tough time tuning 160 meters. And that no way could I tune a 100ft dipole on 160 with a ts850SAT.

So now I wonder if something is wrong with my ts850sat? As it takes the above antenna and matches it 1:1 on all bands?

AS a side note when I used a defective 12ft jumper coax(it had an open in the ground) It wouldn't tune to a low enough match on 160m and had a tough time tuning on all the rest.

With the tuner off can you cw into the hi swr at 10watts?

I know I can dump 10watts cw into a 1:infinity swr on 160m, with the
tuner off.

I can say for certainty the the first few years of any rig they got to get the bugs worked out. I did alot of repairing of Kenwood consumer electronics, while working for Sears Service. The first digit of the serial number is the year of the decade that it was made. The second and third digits are the month of the year. Mine starts with 511 meaning it was made in November of 1995, since they didn't make any in 1985.

If I recall correctly it's the serials that started with 8 and 9 that had the DDS trouble. But that stuff acted up right away to I don't know if you would see any of those that didn't get the fix in.
The other major trouble was on the CARS pc board where the SMD caps leaked. But I don't recall when that was.

My opinion: I'd stick with number 3 or higher that way you are getting the newsr version.

Ray, I think you are mistaken about the serial numbers. If what you
say is correct, my 70 mil series 850 would have been made in 1997.
Kenwood stopped production in 1996 when the introduced the TS870. Many
have agreed in this group that the year of production is the first
number minus 2. Which means yours is actually a 1993 production.

Thank you for confirming that for me. I found while researching that
minus 2 from the serial number date issue. That the years 1990 and
1991 were the bad years for the DDS chips so S.N. starting with 2 and
3 would be the serial numbers that need those DDS IC's unless the part
number on the chip ends in 2, then they have been upgraded.

I had one 850 in the 20 mil range and another in the 30 mil range and both had the older DDS chips. The monitor function on both failed. My 50 mil unit was fine, and the 70 mil I have now has the newer chips in it. I just had to know!!

Topic: 6813 Message: 6831

I just looked in the service manual for the 450S, and it uses the same DDS ICs as the early 850S did, the YM-6631... Did Kenwood change this during production of the 450/690Sas well...? I've never had any problems with my 450S, and I know it has the older DDS chips...Perhaps there is something to the bad solder/pads/vias etc in 850 production idea...The 450S does not use any of the surface mount electrolytics in either the CAR board or the PLL board.... 73...Jordan....

Hi....I wonder if you guys can give me a tip or two on doing the carrier point adjustment for the 850...I haven't yet been able to get it to sound quite right, and I can't see that I'm actually adjusting more than a voltage level, as opposed to an oscillator...

73....Jordan....

6833. Receiver Sensitivity Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-18 10:31:25 UTC
From: Oz
Topic: 6833 Message: 6833

I have a rig that transmits fine across the bands but drops off in sensitivity drastically at 20 meters and above. No atttenuators or RIT are in play and I have checked the logic from the IC that controls the preamp circuits and it is all as it should be meaning that the pins are what they should be on all bands. It works great on 1.8 thru the 10 meg bang but drops off drastically. I have checked the diodes on the RF board more than once thoroughly as I did have a problem with broadcast birdies across the entire spectrum when I got the radio and a diode was the problem so I checked once again just to be certain I had not missed any on the RF board. As I say, TX is fine and I am wondering if there is a common prob here or someone can steer me onto something. I also had to change all the trimmers when I got the rig and did a complete pll alignment with no prob after they were changed.

Thank You in Advance!

John KE7CQ

All I can really suggest is verify the exact frequency where the sensitivity drops, and check to see if there is a circuit,VCO,LO, etc, that is specific to that range....Then I'd check the levels against the service manual...take it from there....73...Jordan...

P.S.....Are you sure you don't mean 22Mhz and above...?

6836. Necessary cables for HRD control of TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-18 23:47:56 UTC
From: bkimura66
Topic: 6836 Message: 6836

Greetings,
I'm new to HAM radio and I'm patiently awaiting my TS-850SAT which will be arriving soon (My first HF radio). I plan to use HRD not only to control the radio, but also for PSK31 receiving/transmitting. Can someone please provide me with a list of required cables? Keep in mind that I'm not very radio technical, so I'd prefer to purchase a pre-made cable versus making one up myself. For the CAT cable, a model name/number would be appreciated. I'm assuming that other than the CAT cable, a pair of 3.5mm 1/8" stereo cables will be needed, but I'm not certain. I've also noticed that my laptop doesn't contain a serial port, so I'm assuming that I'll need some sort of USB-->Serial adapter? Any recommendations on this would be appreciated as well. Lastly, if anyone can provide me with the necessary radio settings that I'll need to make in order to use HRD/PSK31, I'd greatly appreciate it if you could pass them along as well. Thank you!

If you are going to get into PSK-31 and you have any port/soundcard problems I would look at Singnalink USB interface. Check out the info here, http://www.tigertronics.com/ . It has a soundcard built in, and control knobs right on the unit. Easy to use and it works right out of the box. No computer sound card or cable hook up, it is USB. You tell them what rig you have and send matching cable with it.

I use it and HRD as a control for my rig.

Rich , Kd0zz

any sound card interface will take care of the psk, some interfaces also included rig control.

try searching ebay, google.

really is only limitted to how much you have to spend

the only spec you should look in an interface is how it connects to the radio and be ts850 specific

Hi Jordan,

Have you tried this method...

http://n6tr.jzap.com/850repair.html#TS-850_CARRIER_SET_POINT_ADJUSTMENT

If you put on headphones and listen through the monitor
function, you should hear the difference while adjusting. Make sure your IF filters
are set wide and the tone control is fully clockwise.

Actually, I haven't tried that method, but hopefully the carrier point and bandpass still match up ok when I go to SSB and CW modes with the narrower filters....

Does anyone remember the tube type set-up for the same adjustment....? Was it set at the point where the carrier level was 18-20db down the side of the passband...? 73...Jordan....

The following is from W3OZ's website. His description is for bring the low end up on the audio, but the same adjustment procedure applies no matter what.

Max
VE3TMT

STEP #1 PUT THE RADIO ON 14.200 KHZ,MODE EITHER USB OR LSB.

STEPS #2 TURN THE RADIO OFF.

STEP #3 WHILE PUSHING THE F.LOCK KEY TURN THE RADIO ON WITH POWER BUTTON.

STEP #4 A MENU WILL BE DISPLAYED, WITH THE M.CH/VFO CH KNOB, MAKE SURE THE DISPLAY SHOWS (MENU NO. 00).

STEP #5 PUT MODE SWITCH TO LSB. HAVE THE 8.83MHZ FILTER KEY IN THE 6KHZ POSITION. TRANSMIT INTO DUMMY LOAD AND TURN VR501 WHICH IS UNDER DOOR ON TOP LEFT OF RADIO COVER FULLY COUNTER CLOCK WISE WHILE LISTENING TO MONITOR RECEIVER ON SAME FREQ, YOU SHOULD HEAR BOTTOM END OF AUDIO COME UP.

STEP #6 PUT TS-850S ON USB AND MONITOR RECEIVER ON USB SAME FREQ 14.200MHZ.FOLLOW SAME AS STEP #5 TURNING VR502 ALSO COUNTER CLOCK WISE, YOU SHOULD HEAR BOTTOM END OF AUDIO COME UP MORE BASS RESPONSE THAT'S WHAT YOU WANT TO HEAR.

STEP #7 PUT 8.83MHZ FILTER KEY TO 2.7KHZ POSITION, NOW TURN M.CH/VFO.CH KNOB SO THAT DISPLAY ON TS-850S READS (MENU NO.01) SWITCHING BETWEEN USB AND LSB AND LISTENING ON SAME ON MONITOR RECEIVER RADIO, BALANCE AUDIO TONE BETWEEN LSB AND USB USING ADJUSTMENT POT VR503 TO BALANCE TRANSMIT AUDIO TONE OF THE TS-850S.

STEP #8 ONCE YOU ARE DONE AND WANT TO KEEP UR ADJUSTMENTS PUSH THE CLR KEY WHICH IS TO THE RIGHT OF THE MIC GAIN/PWR KNOB, THIS WILL EXIT THE MENU AND LOCK IN YOUR NEW CARRIER POINT SETTINGS ON THE TS-850S.

Hello everybody,

This must be my first post on this group, and moreover my English is not very good so excuse me if I do some mistakes ;o)

I also command my TS-850 with HRD and I bought the DigiMaster DualChannel USB Data-Audio Interface (http://www.g4zlp.co.uk/unified/DM_DUAL_Channel.shtml). It's really great : you just have to plug a USB cable and two audio cables and it gives you one port for digital modes, another one for CAT and the last one for CW transmit.

Works great with my TS-850 and TM-255 (just have to change the cable linking the interface to the transceiver), but of course with the TM-255 CAT won't work !
ZLP Electronics is one of HRD's sponsors.

You can't be wrong with this interface, for 120$ you have a very nice metallic box much cheaper than all the Rigblaster and other expensive interfaces.

Best 73 from Yannick - F8EXM

6843. 500hz CW filter

Yahoo group: TS-850_450_690 (2006 — 2009)

Greetings,
I'm acquiring a TS-850SAT early next week. I'm told that it comes with no optional filters. I'm a new HAM but I do plan to use CW and PSK31 quite a bit. If I was to purchase just one filter (I'm thinking a 500hz), would you recommend purchasing one for the 455khz IF or 8.83mhz IF? I understand that you can cascade the two together, but I'm trying to keep costs down at the moment. If anyone feels that a CW filter isn't even necessary, I'd be interested in hearing why. I don't know very much about radios, but I've read many articles where people state that you really need some filters for this rig, especially for CW.

Thanks,
- Bill, kb1pxd

I'd look for an Inrad filter 400hz for the first IF (8.8) and start there.
If you can eventually afford it, get the same filter for 2nd IF....

Hi Bill,

I would get the radio and try the variable bandwidth tuning before spending the money on the CW filter if you are at all trying to keep th cost down. I have both, and use the CW filters, but not on PSK31. I think you will be pretty pleased with the slope tuning. It is pretty close to having a single CW filter.

Hi Bill,

I guarantee you are going to enjoy that radio! Currently I am using only the Kenwood 500 Hz filter in the 455 IF. I do a lot of CW and RTTY and the narrow filter is a big plus at cutting down the QRM. The slope tuning does work at narrowing down the passband, but in my opinion it is not as good as the optional filter. At one time had the 500 Hz filters in both IF's, but didn't think the difference was that great to afford both. Generally the 455 IF filters cost a bit more. With only one filter in, the slope tuning will not work properly. It will not shift the passband evenly on both sides of center. But I find I hardly ever use it except on SSB.

73,
Max

www.inrad.net and they screw in just like the factory filters and have a
little better shape factor. You cant go wrong with Inrad.

Thanks Max,
I just ordered the 400hz Inrad filter for the 1st IF.
Thanks for the info on your results from using narrow
filters in both IFs, as I was wondering if there'd be enough
noticeable difference to justify the cost. I also just
purchased the matching SP-31 external speaker so I think
I should be good to go. I need to stop spending money. :-)

The SP-31 is a great speaker. I have found the Kenwood filters very acceptable although I have not used the Inrads. I would like to try a pair of the 400 Hz models though. Maybe one of these days. It is hard to find used ones and they aren't cheap new.

Don't you have to do some trimming or adjustments on the Inrad filters
before to install them in the TS-850?????????

Steve, I have a pair of TS-850S with inrads up here in Munford if you wnat
to see what they are like! Yes you have to cut 3 pins - no big deal though!

Good question,
I read something about mods that may be necessary. (Cutting a couple
of pins, etc.) Can someone confirm this?

Three of the five pins on each end serve you purpose. Only the two on
the outermost ends are signal and ground.

Are there no hole slots for the remaining 3 pins, hence they
need to be cut? I assume then that the Kenwood filters would
come with just the 2 pins on each end.

Thanks,

- Bill

Bill,

Personally I have never owned an Inrad filter. But I believe the
custom board they are mounted on has two holes at each end, hence
the cutting of the pins on the Kenwood board. Not really my way of
doing things. The Kenwood filters have five holes on each end to fit
perfect, no cutting is required if you use the Kenwood filters. If you
want to see what they look like yonder over to ePay and search in the
Ham Radio section under "oscillators and filters".

OK, I seem to remember this now. If you cut the wrong pins on your radio, you are screwed, right????? So, you have to be 110% sure which pins are cut???????

I've submitted an email to Inrad asking about the mod specifics. It would be nice if they made the necessary modifications to the module to accommodate the additional pins in the radio, versus forcing you to cut pins. From what I understand however, it's not really a big deal and the instructions are very clear. There seems to be a ton of people using these Inrad 400hz filters in their 850s.

Aloha Bill,
I have Inrad filters in both IF's and find it to be excellent but
mine are the SSB filters 1.8kHZ in the 8.83 IF and 2.1 in the 455 IF.
It makes the radio a WORLD Class rig in a crowded contest band. With
the Slope Tuning it even works great on PSK. Spend the extra and get
the 455kHZ filter you will not be sorry. The INRAD filters are 10
times better than the Kenwood filters I know as I have had both.
Enjoy the new 850 they are most excellent rigs.

Yes Bill I did have to cut some pins on the board but no big deal it
does not effect the operation of the radio in fact you could install
a factory filter anytime and it would work fine as the pins cut are
extra grounds not needed in either the Inrad or Kenwood filters.
Remember "Mesure twice cut once"

Topic: 6843 Message: 6863

Hello...I have the filters in mine...sad part is that
I cannot remember where I put them. I believer from
the sound that I put one in each IF and cascade them.
I have 1.8 for SSB which really does not do much of
anything. The slope tune works better than the SSB
filter does. I would have to say that the 500 in the
455 position works best without the other one in.
Hope that helps some...
Tom

Let me agree... I ordered G4ZLP interface cables a week and a half ago... PayPal seemed to hold up the transaction a couple days, but the cables arrived yesterday and they wored perfectly with HRD software. I chose to connect unisng a USB to dual serial port adapter, and it worked well too.

Neil's cables are professional -- not the things I turn out myself!

Dan AA3LS

(By the way, your English is at least as good as mine, and I'm sure your French is BETTER! Thanks for your comment.)

From: Randy Brothers K9OR
Topic: 6843 Message: 6865

I'll add my 2 cents here...have used every cw and ssb Kenwood and Inrad filter in some combo in my 850's. The Kenwood 500hz filters are very good, but I prefer the 400 Inrads, as I mostly operate cw, and they're great for dx/contest use. Either 500 or 400 would be helpful for psk/digital modes. Cascaded is better, but start with one in the 8.8 if first.
As pointed out previously, the slope tuning will not operate *properly* unless cascaded, but not a big deal. Cutting a few superfluous pins to use the Inrads (it will be obvious which ones when you try to plug it in) no big deal either.

Hello everyone.
I wanted information from radio amateurs experts in the forum,
regarding my kenwood ts-850. Yesterday I did qso and I turned off the
equipment and everything was ok. Today I turned suddenly and the
display did not work. All the rest is ok, ok tx, rx ok, ok memories and
everything else, only the display everything black and dead. I thought
it were a problem of electrolytic capacitor C18 (470 microfarad from 16
volts) I replaced, I reset the unit but the problem continues.
Can it help?

I await info on to help solve the problem.

Is a serious thing?

Thanks to everyone for all the advice. I ended up ordering the 400hz Inrad filter for the 8.83mHz IF. Depending on whether or not I decide to keep the radio, I'll order the 400hz filter for the 455kHz IF down the road. I've confirmed from Inrad that only 2 pins need to be cut on the board, and they can be cut from either side of the slot as the filter is symmetrical. According to Inrad, this filter should be placed in the YK-88C-1 slot, and switch #3 should be set to on. Thanks again for all the feedback.

You need to repair the damaged traces where C18 is soldered in.

Actually, I like this K6LL method...

TS-850 CARRIER SET POINT ADJUSTMENT (without instruments) submitted by K6LL:

/1. Open the little hatch on top of the radio. Locate VR501, VR502.
2. While depressing F. LOCK, turn the transceiver ON.
3. Click the M. CH. control until MENU 00 is displayed.
4. Select LSB
5. Turn the power control all the way down.
6. Push the SEND switch.
7. Make a slight adjustment to VR501 to make your voice higher or lower while speaking into the mic, listening to yourself in the monitor.
8. Put the radio in USB.
9. Make a slight adjustment to VR502 to make your voice sound higher or lower while speaking into the mic, listening to yourself in the monitor.
10. Put the SEND/RCV switch back to RCV, and then press CLR.
11. Listen to on-the-air signals on both USB and LSB to see if additional adjustment is required./

Bill,

Just a note... because I don't believe anyone has mentioned it yet.
With relatively matching bandwidth filters in BOTH IF's, you'll find the
variable bandwidth tuning (VBT) come ALIVE when you go that route. The
850S already has a world-class receiver, this configuration just cements
its interference fighting capabilities.

Examples of what I am talking about:

- Pairs of Kenwood 500 Hz filters in both IF's
- Pairs of INRAD 400 Hz filters in both IF's
- Pairs of INRAD 2.1 KHz filters in both IF's (Note: This narrower
pair will allow the VBT to adequately narrow down bandwidth for wider CW
operations -- equivalent in capabilities to the wider 500 Hz pair
mentioned above)

Right now, I personally have a pair of INRAD 2.8 KHz filters in both
IF's (for nice 75M SSB ops), and also a INRAD 400 Hz filter for CW in
the 8.83 MHz IF.

For the upcoming solar cycle peak, I haven't decided to go with matched
2.1 KHz or 400 Hz INRAD filters -- it depends on how heavily I delve
into CW again.

Thanks Clif
but I checked all the tracks around the condenser and C18 are all ok, I also changed the other two electrolytic capacitors from 100 microfarad 16 volts but the display still does not work. I do not understand what happened so improvvismanete. Do not know about control.

I believe that I must send rtx assistance because the problem is more serious than I thought.

Thanks to all.

Kenwood TS-850SAT, Includes PS-53 power supply, original microphone and power cord, original users manual and original service manual. Rig has a minor issue with the speech processor on 40m and below, but if you don't use the proc, it works and sounds fantastic. Nice condition cosmetically, no marks or scratches, minor wear around some dials. Asking $700.00 for everything, firm.

Greetings everyone,
My TS-850SAT will be arriving sometime tomorrow. The previous owner has claimed to have made several mods. (DDS, NB, ALC, etc.) As a new owner, is there an easy way for me to confirm what mods have been made to the radio, and whether or not they're the latest recommended mods? (i.e., can I cross-reference against some TS-850 mod list and compare component/board part numbers, etc.) Considering that I may want to sell this rig a few months down the road, and this question will most likely be asked, I'd like to be prepared to provide someone with the mod specifics. Thanks in advance!

Hi Bill,

Some of the mod tests can be performed without removing the covers. For example, to check for the 60m mod, tune to one of the 60m allocated frequencies and hit the send button. If the red TX LED lights up, you're good to go.

For the NB mod, you will have to try the NB on some electrical noise like a car alternator or some power line noise. If you don't notice a difference you may have to do a visual inspection which involves removing a small board under the top cover and see if the two offending capacitors have been removed.

For the DDS mod, you have to remove a cover to actually see the CAR board. Take off the top cover and remove the metal shield on the left hand side that houses your filter switch board. The CAR board is underneath the shield.

Not sure what you mean by the ALC mod. But where to find the ALC fix?? When you remove the top cover, look directly under the wide ribbon cable on the left hand side that runs from the rear of the front panel to your filter switch board. The small circuit board fastened down below is where the NB caps are located (on the bottom side of course) and the DC-DC converter board is the little vertical one sticking up on the right hand side of the board. Some times resistors are switched on the DC-DC board to increase the negative ALC voltage. This is really just a band-aid and doesn't solve the problem.

For the broadcast band mod, tune the radio to a local AM broadcast station and note the signal strength. It should be somewhere in the 20-30 db over depending on how close it is to you. If not, then chances are the mod was not done. It involves soldering a jumper on the RF board on the bottom side of the radio.

Enjoy your '850.

Max

I can vouch for that! My current 850 is my 5th. Between owning many other radios in between I have always come back to the 850. It will still outperform many of the newer radios available today. Would love to have the 870 but they still command top dollar, and for good reason.

---------- Original message from "Andrew J. Peltier Jr. KI4HVN" <andy_peltier@...>: ----------

Hi All boy am I stuped a friend came over and turned the rig on and
then he turned the RF nob clock wise and presto. He left laughing
saying Andy Andy. Just wasn't my day. Thanks for the reply.

73 Andy J. Peltier

Don't feel bad, Andy! A few months ago I bought a TS-870 through a local ham. I didn't have a chance to operate the rig before I bought it, but between knowing the guy for quite a while and trading with him in the past, I felt comfortable in his assessment of its condition (the rig belonged to another area ham who I didn't know). I got it home, made a space on the bench and fired it up. And then, I almost cried. I had never owned a radio that the receive was so poor on - signals were weak, distorted and generally crappy. Even the local AM talk station I use as a reference sucked. I checked the usual suspects - RF Gain, check. Antenna input, check. Attenuator off, check. No change. I grabbed another beer, cracked open the manual and looked things over again and there it was.... The 870 has a variable AGC control rather than a simple fast-slow-off switch, and a coworker who is also a ham but never met a knob he could resist turning had cranked it all the way back while he
was looking at it. I only kicked myself for about half an hour.....

73,
Mike N5UKZ __.

Bill,

I think you have a tough choice to make! :-)

The K3 posted some superb scores in recent ARRL Lab tests. My eyes popped when I saw the results. (See this month's [April] issue of QST.) The graphical presentation of tested-rig performance QST has been using of late makes it easy to compare tested rigs. Of course, the '850's review was done before that format was adopted, but the numbers are there.

I think the TS-850 is a great rig; I love mine. But I'd welcome the chance to play a K3 alongside the '850. If you could do it, that'd be my suggestion: compare the two side by side. Your operating needs and preferences -- as well as cost -- are factors to consider.

73,

Paul / N1FB

I would love to try a K3. However, the 850 still can't be sold short. The performance amazes me day in and day out. I am primarily a CW op and have every one of them but one confirmed. Most of these via CW. I just can't imagine not having one. The TS-870S is nice too.

Mike, great story. I have two TS-870's. I usually operate the 850 next to one of the 870s but the 850 is off the Clif to get well again. So, I brought out the other 870 fired it up and Wow......what happened to it??????? I sat there and stared at it scratched my head a few times, stared at it a little longer and then it dawned on me. The variable AGC. Not the first time it has happened to me and probably not the last. You know what the second thing to go with age is, right????????

6887. front foot extension for ts-850?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-25 22:34:20 UTC
From: bkimura66
Topic: 6887 Message: 6887

Greetings,
I just got my TS-850 and it's SWEET! Cosmetically
it's close to perfect. (no scratches, wears, etc.)
The only cosmetic flaw is that one of the front foot
extensions is broken. It's not a huge deal, but considering
everything else is so pristine, I figured I'd make a post
to see if anyone could either sell me one, or point
me in the direction of where I could obtain one?
Any help would be greatly appreciated. Thanks everyone!

I am looking for the extensions for a TS-870S. I found them listed at www.kenwoodparts.com. The problem is there are two different parts that appear to be the same. The best way to search is by model number, i.e., TS-850. It is a long list but you will have a hard time finding the particular part unless you have the service manual. I believe there might be a parts facility on the west coast too. Perhaps others have some ideas.

Thanks Steve. I've checked a service menu and found the
part#. (J02-0423-04) However, on the site it lists this part as being
discontinued, and refers you to part# J02-0423-24. The description
for this part is "FOOT W/INSULATOR R600 TS-940S" Any idea if this is
compatible with the TS-850?

Thanks,

- Bill

Hi...Im looking for an RS-232 interface for Kenwood TS-850s or 450S... I have just had surgery on my hands, otherwise I'd probably just build something....I'm in Calgary Canada...let me know if you have anything like an IF-232C with cable, or an inline MAX-232 type device, or anything as long as it's protected and uses opto-isolation......73...Jordan.....

Hi, Jordan:

Try the Piexx -
http://www.piexx.com/index.php?main_page=product_info&cPath=7&products_id=23

I've used one with a TS-690 and 790.

73,
Mike

Hi Jordan

Go to eBay and do a search for G4ZLP. He sells a great interface for the TS-450SAT. I have 2 of them here along with 1 for my Yaesu. Price is right and great service. They are plug and play. 73

Jordan,

Let me second the below opinion. I bought two of the
IF-232-equivalent interfaces from Neil (one for the 850 and one for my
790. Work great, good price, quick delivery (a bit over a week from
start to finish, but PayPal took a couple days to pay Neil over there
which delayed everything a couple days... still, less than two weeks
in total order to parts in hand.

HamRadio Deluxe works well in controlling my rig, and its price is right.

Dan

A quicky course on Kenwood's parts system.

The first 3 indicate the category of part, The next 4 are the PN, the last 2 are the rev #.

In your case the original PN was J02-0423-04 which was replaced by the J02-0423-14 which was replaced by the J02-0423-24. Same part different Rev #. Note the category and PN stayed the same. The rev changed to an upgraded or modified part, same function and fit.

The foot on the 850 is a 2 part deal. The extension or outer piece is PN J02-0423-24. The inner piece is J02-0424-04.

The 870 is a one piece deal J02-0474-05 or by now it could be a -15 or -25.

Get the picture?

Clif

Very good Clif. Thank you for the detailed explanation.
Now I just need to figure out if I need the inner piece
is broken as well. Considering how cheap the parts are,
I may just order a pair of each and replace both front
feet.

Thanks,

- Bill

Topic: 6898 Message: 6898

Hello everyone,
I received my TS-850 yesterday afternoon and I noticed that the previous owner (or the owner before him) appears to have made some sort of Transverter mod. I know very little about HF radios but is this anything that I should be concerned about? Please follow the URL below to see the back of the radio:

http://bkimura.smugmug.com/gallery/4588540_zMDQZ#270554924_HxaRV-A-LB

I have emailed the previous owner to see if he can elaborate on the mod. If there's anything I should checkout, please advise.

Thanks!

- Bill

Hi Bill,

I once performed a similar mod on one of my 850's. In my case I broke the line from the RF board going to the input of the final amp. This way, you get a low level signal to drive a transverter, in my case the TenTec 1210. I actually routed the RF through a switchbox so I didn't have to keep removing the coax jumper to run HF.

73,

Max

Thanks Max. The radio appears to be working fine, but I'm concerned that this mod may somehow impact the radio in a manner that I haven't yet discovered. At this point I'm only receiving so I haven't been able to test transmitting on the various bands, etc.

- Bill

Bill,

After looking at the picture of your rig again, that doesn't look to be the same mod as the one I did. It appears that you have a separate low level TX output, and a separate receive input. I would not suggest using a jumper between these two points. Once you get transmitting, check the output power on the TX jack and see what you get.

Hi Bill

I think that is similar to the modification made by TK5EP:

http://tk5ep.free.fr/tech/ts850/en/ts850_g.php#TS850S%20SEPARATE%20ANTENNA

Look at the Fig. 1 and 3

I think this modification will have no affect to the preformance on HF.
Proably you can ask TK5EP about details of his modification if you
discover that it`s similar to yours.

Any ideas on what could cause the display to read mostly 888's when powered up. I did a reset on powering up and still have it. I don not know when or if the battery was last replaced.

Debatable Bill. The IF OUT jack can be configured for use as a
transverter RF out signal. If it is in fact the separate RX antenna
mod, it is a very popular one.

Thanks Max,
This is from the previous owner:

.......Pressing the button switches the signal to the driver stage
completely
so there is apparently no danger of accidentally transmitting into a
transverter.
The RX input is also switched away from the main antenna jack to the BNC
connector in back.........

Not sure if that answers much though.

Sorry, left out part of his email:

The front panel "Dim" button activates it...turns out the TS-850 doesn't
have an abundance of display brightness so the dim button appears to
have been a logical choice....you wouldn't really want to dim an 850
display anyway!

I operate my 850 with the display dimmed. I figure it saves wear and tear on the display, and I don't have any issues reading the display that way.

Actually, our kitchen stove has a similar display for time and temperature, using the Vacuum Florescent Display technology. Over the past 15 years or so, the brightness has dimmed a lot (like burned-in phosphors on a static CRT display, or "used up" electron emission). Replacement of this component is far more expensive than a new stove these days! If you can see the display on dim, you may well extend its life a lot. (Computer control seems to be an option here, as well.)

Jordan,

Let me second the below opinion. I bought two of the
IF-232-equivalent interfaces from Neil (one for the 850 and one for my
790. Work great, good price, quick delivery (a bit over a week from
start to finish, but PayPal took a couple days to pay Neil over there
which delayed everything a couple days... still, less than two weeks
in total order to parts in hand.

HamRadio Deluxe works well in controlling my rig, and its price is right.

6916. QRN/QRM reduction tips for TS-850?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-28 11:38:32 UTC
From: bkimura66
Topic: 6916 Message: 6916

Greetings everyone,
Can anyone recommend some tips for getting rid of background noise on a TS-850? I'm referring to the typical hissing/crackling that you hear on the bands. I've done the following thus far: (Please let me know if I'm on the right track)

* Activated AIP - My understanding is that activating AIP disables the pre-amp, which really isn't needed on most of the bands. It just seems to amplify the noise as well as the signal and doesn't improve your signal-noise ratio at all.
* Reduced RF Gain - This has helped the most. By backing off the RF Gain from "10" to about "8" or "9" seems to help tremendously. This seems to control the signal strength at which a signal will be attenuated. (i.e, if I adjust the RF Gain to S7 on the meter, all signals that are weaker than S7, such as noise, etc., are attenuated) The one side-effect seems to be that you could miss a weak signal while scanning through the bands.
* Slope Tune - This helps some.
* Notch Filter - This can help, but for most signals, it seems to hinder the audio quality some so I tend not to use it.
NB Filters - These don't seem to do anything when dealing with typical band noise.

I'd be very interested to hear from other experienced TS-850 owners as to what they've found to work best when dealing with noise. I love the receiver on this radio and it seems to have an enrmous amount of potential if adjusted properly. This is my first HF rig so I've been just winging it the past couple of days experimenting with different settings.

Thanks,
- Bill, KB1PXD

I stand corrected on the NB. I've noticed that either NB1 OR NB2 (I have them both on now) will pretty much eliminate the "crackling" sound that I'm hearing on 80m.

Hey Bill,

The 850 receiver was rated one of the best in the Sherwood reviews. It looks like you are doing everything right so far. I never turn my AIP off. The notch filter is an excellent one, but yes in some cases it does hamper the receive. By using a combination of the slope tuning and notch I have been able to work lots of nice DX on 40 CW and I still need my narrow filter in!

If you don't notice any difference when you activate the noise blanker it is possible the mod has not been done. You may need to experiment on different types of noise to be sure. The mod is very easy to do, it take more time to get at the board than doing the mod itself! There is information in both the FILES and PHOTO sections of this group.

Have you tried any external audio filtering? The Timewave DSP series are very nice and I had great success with the DSP9+. I am now using a program called DSPFIL,

http://www33.ocn.ne.jp/~je3hht/

It is a basic audio DSP program that do help alot with its DSP functions. Of course it is only audio DSP, not IF, so strong nearby stations may defeat its effectiveness.

Enjoy the 850! Still want a K3??

73,
Max

Topic: 6916 Message: 6919

Thanks for the quick reply Max. You've probably seen my follow-up post by now but the NB settings (either one) does in fact remove some of the crackling/popcorn-popping sound that you sometimes hear. I've also noticed that it'll drop the noise on the S-meter a fair amount as well. This is a late serial number rig, (S/N 71200055) and the previous owner did numerous mods when he first received the radio, including the NB mod. Although I don't have another HF rig to compare it to as my previous receiver was a Grundig G5 SW radio, it truly appears to be a magnificent radio. Although I have no plans of canceling the K3 order, I'm starting to seriously consider keeping the TS-850 and just delaying the K3 shipment until a later time. I added the 400hz Inrad filter yesterday and I've picked up the SP-31 speaker. It's hard to imagine that you can do much better than this radio, especially from a receiver perspective. Thanks again for the response.

- Bill

I don't know about that. My experience is I turn the so called rf gain
all the way up. And use the volume control. The human ear has a non
linear roll off, I use that roll off, to tweak out the noise.

I remember when they used to dupe VHS tapes they used an enhancer that
put noise into the video. I use the notch and slope controls to get
the noise pleasant to the ear, to the point where I can hear the
signal better, even though, if you put it on a scope it would make you
wonder how you could hear any signal in all that noise.

Most of the signals I see don't even budge the s meter no matter where
it's the rf gain is set. I only had this rig for 3 months.

I just turned on my stove and the ignitor circuit creates noise that
the noise blanker takes out. Turned on the blanker and the noise was
gone. I imagine that it would be good in the mobile taking out
ignition noise.

I like the interesting comments so far. I say adjust your radio's receiver by trying the different methods presented here.

I have a few suggestions after owning TS-850SAT's since their inception and offering:

* Use slow AGC when you can. It's smoothing effect is noticeably easier on the ears.
* Engage the AIP zero-sum (or low-gain) front-end stage on 160, 80/75, and 40 meters -- or on bands full of really strong, greater than S9 signals. It improves the receiver's intercept point slightly, but the reduction in atmospherics is noticeable.
* Reduce your RF Gain, with or without the AIP engagement. If signal strengths vary greatly, drop the AGC response time from slow to medium for quicker SSB recovery of the first syllables or short words. Almost exclusively, I run the AGC at medium on CW or digital operations, adjusting the RF Gain and AIP features accordingly.
* Usually, I run my volume control pretty high, pushing the audio amp's dynamic headroom to near distortion levels. I suffered multiple ear infections and a high fever as a child and baby, and listened to loud Rock as a teen (still do once in awhile!), and spent 21 years around flight lines in the Air Force, so I have lost some of my overall hearing. But that being the case, having most of the receiver's audio dynamic range (the TS-850S series have wonderful, wide dynamic range audio amps for ham rigs) through high, near distortion level settings, allows you to tailor the receiver's astounding RF dynamic range capabilities using the RF Gain, AIP, and other interference fighting features available, such as the effective VBT controls.

Someday soon, I am purchasing LDG's RCA-14 breakout box for the 13-pin DIN connector. It'll offer quick change flexibility for varied station activities. One of those, is accessing the fixed, low-level audio output of the 850. I have a nice Bogen 20-watt audio PA amplifier I'd like to use while operating CW, possibly SSB. The Bogen would drive some classic and out-of-this-world sounding JBL bookshelf speakers to listening levels my 850's internal audio amp could never do.

I hope these, and others' suggestions, present ideas for you to try. Have an open mind, try them all, and find what works best for you. YMMV.

Oh yeah... two more things.

1. If it hasn't been done already, perform the NB mod to the 850.
2. Matched pairs of International Radio SSB or CW filters will make the receiver in it absolutely incredible. Depending whether you're a SSB or CW guy, you cannot go wrong with matched 2.1 or 400 Hz filters. They make the VBT controls come ALIVE! The Q of these controls, only with matched, quality filters such as these two pairs, rival or equal their DSP counterparts -- without all the digital artifacts and terrible sounding audio.

Thank you very much Steve for taking the
time to write up these recommendations.
I'm pretty sure that this radio has had all the
mods, including the NB mod, and I just picked up
a single 400hz Inrad filter for the 8.83mHz IF.
I'm new to amateur radio but I plan to operate using
CW/PSK31 modes most of the time.

Thanks,
- Bill

6925. Occasional beep

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-29 20:59:47 UTC
From: bkimura66

I've been noticing that my TS-850 emits an occasional single "beep". I've noticed it on different frequencies so I'm assuming it's coming from the radio and not being transmitted on the frequency. I haven't timed it but it seems to come at regular intervals. (i.e., every few minutes or so) Any idea what this might be?

Thanks,
- Bill

Hey Bill,

That's interesting, too! On a particular freq in the 40M CW band, there's a singular dash "beacon", somewhere between 7030 and 7040, if memory serves me correctly. There might be one or two more others (maybe the same on but further up the low end of 40M) operating. From what I hear, it's some kind of clandestine thing emanating from somewhere in SE Asia, emitting those beaconing beeps or dashs for hours or days on end, until... a short number group is sent.

We Alaskans hear SE Asia like it's next door, for the most part. It's quite prevalent.

Are you hearing the same thing?

I'm hearing it on numerous frequencies however, including on 80m right now. (3933) I suspect it's coming from the radio. It's every 5 minutes right to the second.

I turned the volume entirely, and the beeping appears to be coming
from the right bottom corner of the front the radio. (Right near the
SLOPE TUNE knob) ...again, every 5 minutes...a single beep

Hi all,
I notice this things. In these days many of us have a computer in the shack. I notice big signal on 160 Mtrs like Sig 9. I try to do my best to reduce it. Also I notice that when I TX with some more power the computer shut down and internet goes offline. I found the solution for this problem. I make an extension wire about 30 feet long and I turn it in many turns about 15 inch diameter and I use it to plug the computer with it. With this wire the Noise level from Sig 9 goes down to S5 and sometimes lower with no AIP, 6db, 12db buttons pressed. I notice also that when TX with power the computer and also the internet remains connected. I use to use the 6db button to lower a little bit more the noise level, mostly to hear DX stations in CW. The AIP will lower too much the signal level so did not use it for DX stations.
I think that this info will help someone.

Hi Paul,

I forgot that point... the attenuator buttons! The 6 dB attenuator is a wonderful way to reduce noise levels, without resorting to the sometimes "more than too much" drop in gain the AIP portends. Signals do pop out of the quieter background when the 6 dB pad is used. Good thought, again!

6932. Re: QRN/QRM reduction tips for TS-850?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-30 00:23:20 UTC
From: Dan Janda
Topic: 6916 Message: 6932

Another technique for this (rfi) problem between your rig and computer... get a toroid and wrap a few turns of the computer's power cable around it (through it). It may also be helpful to do this to other computer related cables.

What you've described is conducted rfi being conducted out of your computer into the radio's environment.

In my own case, my HF antenna is about 40 feet up and 100+ feet away from my TS-850. There was a lot of noise this morning on 80 meters... I had the computer on to review some net procedures. To check whether the noise was my computer or from outside, I switched the antenna to see what I'd hear with the antenna grounded. Noise (and signals) went away. Switched back on, signals and the S9+ noise were back.

I felt confirmed when several other net stations remarked about the high background noise as well.

In your case, Paul, you might also check to see the PC case fastners are tight, and maybe check the routing of cables behind the rig and computer. Still, sounds like you fixed your problem.

Thanks for contributing,

Dan

> Hi all,
> I notice this things. In these days many of us have a computer in the shack. I notice big signal on 160 Mtrs like Sig 9. I try to do my best to reduce it. Also I notice that when I TX with some more power the computer shut down and internet goes offline. I found the solution for this problem. I make an extension wire about 30 feet long and I turn it in many turns about 15 inch diameter and I use it to plug the computer with it. With this wire the Noise level from Sig 9 goes down to S5 and sometimes lower with no AIP, 6db, 12db buttons pressed. I notice also that when TX with power the computer and also the internet remains connected. I use to use the 6db button to lower a little bit more the noise level, mostly to hear DX stations in CW. The AIP will lower too much the signal level so did not use it for DX stations.

6933. TS-850 Beeping. PLEASE HELP.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-30 12:51:28 UTC
From: bkimura66
Topic: 6925 Message: 6933

UPDATE: The radio continued to emit a single "BEEP" every 5 minutes throughout last night after the radio and power supply were shutdown. For the record, I was told that backup battery had been replaced when the previous owner had purchased the radio 2 years ago.

Thanks!

- Bill

There is nothing in a stock 850 that will beep with the power off, The backup battery is for memory only, there is no speaker or anything that will beep connected to it....

FALSE ALARM, MY BAD! :-) It turns out that the beep was coming from
my cell phone which was buried under some paperwork next to the radio.
My deepest apologies.

Bill, I'm laughing but you are dangerous. I hope you are laughing too.
We are all probably envious that you are having so much fun learning
about your new radio.

don't feel so all alone Bill,
last time I went through a similar situation......
faint steady tone about 600-800 hz
I have 3 computers on the same desk as the rig(s)
took me to days to find my pico keyer,
buried under some paperwork was keyed up.
unknown to me I had pushed the straight key up against
something and caused the shorting bar to key the keyer
but since the keyer wasn't plugged into a rig,
I never heard a sidetone loud enough to identify the source

I tore down 3 computers, a clock, and 2 power supplies looking for it
sigh....
the joys of to many toys, hi hi

6938. TS850SAT +DSP-100 FUNCTION?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-03-30 23:07:54 UTC
From: dmschertzer
Topic: 6938 Message: 6938

Got a DSP-100 and notice when I use the TX button on the DSP-100 (pushed-in) I'm unable to auto-tune correctly, keeps going and going.

When I tune the TS850SAT 1st then press in the TX on the DSP-100 all is fine.

Am I missing a step-up function? or what? Clear a mud.....thanks

Is there not a carrier level control on the DSP100? If so it may need
to be turned up.

Hello Group,
I'm new here, and am interested in buying a TS-690S in fairly good shape cosmetically (6-7 out of 10), and fully operational. Will only pay with Pay Pal.
Tnx es 73,
Ed-W3BMW

Like movies? Here's a limited-time offer: Blockbuster Total Access for one month at no cost.

Well, it's working fine now...huh? Carrier level was set 1/2way on the DSP-100. Gremlins I figure. thanks.

6945. Re: Symptoms of TS-690S oscillation

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-03 14:28:52 UTC
From: aa5te
Topic: 6607 Message: 6945

OK. I tried the bias adjustment (it was spec on before, and I adjusted it both ways a little to troubleshoot and check for symptoms - they are still there). Thanks for that suggestion, though, it was something I hadn't thought of.

Anyway, further info now:

I initially reported these symptoms existed with a dummy load, but I can't get them to reproduce on the dummy load any more. They only occur when an antenna is hooked up (fed with new RG8U - 6M super J-pole, yagi, or doublet (ladderline fed), all greater than 30' away from the rig).

Also, the symptoms occur at greater than approximately 25-30W. At or below this level, operations appear to be fine/normal. Crank up the power anywhere above 25W on the 690 meter, or 30W on the tuner's meter, and problems return. Since this seems power related, potentially RFI back into the rig, I've adjusted my grounding setup, added 6M radials to it, removed all ground connections to the rig, all without any change. As an aside, I used to get RF shocks/burns and RFI on 6M, 12M and 17M (relatively closely harmonically related it seems) before I upgraded my grounding system, now they are non-existent on all bands. But I upgraded my grounding well before these problems appeared.

The symptoms occur with/on voice peaks, or sending dits with a key (not dashes). If I instantly key down for a very long dash, operations at full power (50-60W) are fine for a while. If I send a string of dots, the problem almost always (90% or more of the time) appears immediately. Same with voice - a long "ahhh" or whistle is good for a bit, until I unkey or start talking normally, then the problem returns. It almost seems as this is an ALC related problem, but I hadn't adjusted it prior to this, and now have a little (actually a lot, the pot was taken to both limits without a change in behavior) in both directions without any luck (or change in behavior).

Is it time to send it in, or is there something else I can try (I could just keep it at 25W - it shouldn't make a big difference in my signal: 3db, 1/2 S-unit, I know...)?

One more thing - I modded this 690 and my other one so that the built in AT works on receive as well as xmit by cutting a few board traces and putting a jumper in the appropriate place on the filter board, but this doesn't function on 6M anyway - just thought I would throw that in, and I did this mod long before this problem appeared.

Possibly RF getting back into the radio? The lower the power level the less chance of this happening which explains why it disappears when you decrease power. I have had all sorts of strange conditions, some into a dummy load as you describe and some into my longwire on certain bands. For example if I use the longwire on 10m it locks up the computer. If I use it on 160m it causes my internet connection to go out. I have also modded my 850's tuner for receive as well and found this to have no effect on the problem.

Greetings everyone,
Tomorrow I'll be putting up my 1st HF antenna. (Cobra Ultralite Senior) Can someone please advise on what the PWR & CAR settings should be set to prior to auto tuning? Also, any other tips pertaining to auto tuning would be greatly appreciated.

Thanks,
- Bill

reading the manual and the meters you have either in the radio or inline will have to tell you exactly where to set the knobs, because at least I have found that every antenna gives the radio different charachteristics, so setting can change.

Crank them both to the right as far as they will go. If the tuner
doesn't achieve a match in a few seconds check your connections.

6950. Auto Tuner for TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-06 12:49:36 UTC
From: bkimura66
Topic: 6947 Message: 6950

Hello,
I installed a multi-band cobra ultralite senior antenna yesterday afternoon. The TS-850 ATU seems to tune every band with the exception of a small range within 20m. (14.230 - 14.350) However, I can tune 14.100, 14.150, 14.200, etc. I cranked both the power and car level fully clockwise prior to tuning. Questions:

1.) Does this sound like typical behavior?
2.) Does the ATU beep if it's unable to achieve an SWR of 1:1, or does it beep if it's unable to achieve an SWR of 3:1 or less? (The SWR meter shows about 1.4/1.5 when it finally beeps)
3.) I haven't tried it yet, but should I attempt to manual tune these sections of 20m?

As always, any tips would be greatly appreciated.

Thanks!

- Bill

If it emits a series of beeps, it is not able to achieve a match. If it beeps once and the tuner stops, it has achieved a match. At least this is my experience with these tuners. If you are saying you are getting a match of 1.5:1, that would be fine as far as I am concerned. I assume you aren't seeing any power fold back when you transmit? It isn't necessary to have a flat SWR.

Hi Steve,
I'm getting a series of beeps, and I'm noticing the SWR is at around
1.4/1.5 when the series of beeps emits. I guess my question is this:
Is it beeping because it's unable to achieve a 1:1 SWR, and that last
reading on the meter is the final SWR, or is it beeping because it's
unable to achieve an SWR of 3:1 or better, in which case I have a
problem. I don't have any way to measure power unfortunately.

Thanks for your reply.

I can't really answer that. However, the internal tuner on the radio
can't tune everything. It is possible there is something about the
antenna that it doesn't like. A friend of mine used my TS-450S in a CW
contest and tuned a 40 meter dipole to 80 meters with the internal
tuner. He burned it up.

Bill,
take another 50 ohm cable, connect to cable from ant (as extension)
and try to tune again. You will see. If better then check all bands
again because there can be "problem" on some other band with new
lenght. As I do not know more about your antenna this is my first
idea...Then you can look for the best cable lenght compromise or
switch cable for some bands etc...
Maybe this can help and you will have some other experience :-)

may I suggest you try inserting a few feet extra (6'-12' for example) into your
existing feedline length.... perhaps it's just not a good length. would be
simple enough to try.

Hi Bill

What is the SWR without the tuner?? You should actually strive to get the best SWR possible, then use the tuner. It will work better that way. 73 and have fun with the new antenna.

Bill . I always try to adjust my antenna up with the radio straight through "no antenna tuner" with a external SWR meter. Then when I know the antenna is good the ATU can take out any small discrepancies as you tune across the band. It is difficult to get an commercial multi band antenna to have good SWR from the CW thru the SSB section all at one time.

Rich , Kd0zz

Subject: [TS-850_450_690] Auto Tuner for TS-850

Hello,
I installed a multi-band cobra ultralite senior antenna yesterday afternoon. The TS-850 ATU seems to tune every band with the exception of a small range within 20m. 6958. SWR problems at the top of 20M

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-08 00:07:03 UTC
From: bkimura66
Topic: 6958 Message: 6958

I posted this already but I'm going to try one more time to see if anyone has any more suggestions:

I installed a Cobra Ultralite Senior antenna. I'm using all 100 feet of ladder line, to an LDG 4:1 balun, to 8 feet of RG8X coax into my TS-850 rig with a built-in ATU. All bands tune 1:1 with the exception of the upper half of 20m. (14.225-14.350) This section of 20m will at times tune as high as 2:1, thus dropping my power output by about 50%. At best it does 1.5:1 which isn't too too bad. Any recommendations on how I can resolve this? Should I add additional coax? Should I need to buy an external tuner? I was expecting to have tuning problems with 160m but not 20m. All other bands tune perfectly 1:1, including the lower half of 20m. Please help.

Thanks,
- Bill

1.5:1 is near perfect. What are you concerned about Bill?????? Is the power on the rig folding back? Most of us don't operate resonant antennas that are perfectly flat. I believe someone suggested that you add a piece of coax to the line. It might solve the problem. Otherwise, I wouldn't worry about it at all.

Many times it's at 2:1, and as I had mentioned, the power drops to around 50%. That's not acceptable. I haven't had a chance to try the extra coax yet but I plan to.

Thanks,
- Bill

Sorry Bill, I was speed reading.....Sure, try the additional piece of coax. It works for me between exciters and amps. I had a TH-5 up once that only gave me 2:1 on 15 meters. The extra piece of coax fooled it. When I moved and put it together again it was flat without it.

Regards,

Steve

No problem Steve. Thanks for the advice. So you think an additional
6 feet may do it? I'm not concerned with 1.5:1 as that seems to have
a negligible impact on my power output, but once it approaches to 2:1
or slightly higher, the power output is reduced considerably.
Thanks again for your response. Is this type of behavior expected
with a multi-band dipole? Excuse my ignorance but this is my first HF
rig/antenna, and I just got my General ticket over the weekend so I'm
still very GREEN. :-)

6963. Memory Encoder WO2-1660

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-08 01:26:42 UTC
From: Crownhaven
Topic: 6963 Message: 6963

I am trying to locate a memory encoder, WO2-1660 for TS-850S. The usual suspects, East Coast and Pacific Parts do not have it. Any assistance would be appreciated. Maybe someone out there has a sick TS-850S that can be parted out.

Regards,

Steve, N4JQQ

This antenna must have a problem in this portion of the 20M band. Put a antenna analyzer on it to see if in fact it is the antenna or the RG-8X feed line I have had problems with RG-8X even in short sections. If it is the antenna send it back and get either a new one or your money back. Of course 1.5:1 is not a bad match. After looking at the makers web page I see it is a multi-band wire that claims to be the best thing since Wesson Oil it is more like snake oil. If you want a good all-band antenna build it yourself either with traps or a Fan Dipole. Antennas like the G5RV and this Cobra are poor at best. It is just a long dummy load. Sorry to sound so rash but I have tried a few of these and was very dissapointed everytime. It got to the point I wiped out my savings and bought a Tower, Beam, Rotor and LMR-400 coax :=)

Roland is pretty much on the money. When I first got on the air, I had a 40 meter dipole that I used on 40/15 and a 20 meter dipole. We have all looked for the perfect all-band antenna but there aren't really any. Something has to give.

Topic: 6958 Message: 6966

Hi Bill

It is kinda hard to use a 4:1 balun on ladder line.

The impedance from band to band varies too much. If you put up an 80 meter dipole, and use the 4:1 balun with the twinlead, it would work pretty good as you would be matching the 50 ohm coax to about a 75 ohm load.

But on 40, the antenna now has about 4000 (I may be wrong on this, but don't think so) ohms impedance, and you are trying to match 4000 ohms to a 50 ohm feedline, so you can see what the SWR would be. And it varies from band to band.

I'm not sure of the configuration of the Cobra is, but I'm sure it has the same impedance problem when going from band to band.

If your antenna tuner would let you, you'd be better off to run the twinlead all the way to the shack and use the tuner to match it. Then you could use the tuner in the '850 to tweak it when moving frequency a bit. 73 and GL!

I did not want to say it before and put down you antenna but I agree with Roland , many antennas claim to do it all. If the antenna is resonate on a frequency it will transmit all the power in a set pattern. If it is not, a tuner will fool the radio into putting power out but the power can be lost in the line or if the antenna is not producing a good radiation pattern. Any multi-band set up will be OK in a small amount of the band and a compromise every where else.

I have a ☐fan☐ dipole on 80, 40,20,17 and 10 , it works good on PSK frequencies but it gets ragged in the upper parts of the SSB area. My 15m beam is SSB only. The only wide band antenna I have is a 20m vertical, it is a 4 ¼ diameter ☐cage☐ of 8 wires. The center is 30 ft high and it has 16 radials adjusted in spread to give 50 ohms. It covers 14.07 to 14.20 with a 1.2 SWR , above and below that the tuner will work. If some one you know has a MFJ 259B or other analyzer have them put it on your antenna , it will spot any problems. Like I said in a note before I always try to get my antenna as good as possible with a SWR meter then let the tuner take of the small stuff. I have made and tried the GR5V type and Windom type, I had a full size 40m vertical with radials in the center of my shed , and a Wilson multi band vertical to compare them to , the full size resonate antenna would win out in the long run (nothing wrong with my 40M vert , it is down for rework into a 5/8 wave 20m vert.)

Many years ago, as a Navy Electronics Technician, I learned that a 35 foot long whip worked against ground (the ship and the ocean!) worked pretty well on any frequency, without regard to wavelength resonances. The way we did it was with an antenna tuner (generally close to the base of the antenna) which had to be tuned as frequency was changed. We generally worked where we needed with 500 watt output SSB transmitters. I'm convinced antenna length is not critical once you have a reasonable point -- you need current flowing (in a standing wave pattern) on the antenna conductor(s) if you want radiation.

I generally get satisfactory (not great, but satisfactory) results on almost all bands (I don't know of one that doesn't work at least OK) using a fairly low (50 foot) 80-meter dipole fed with about 150 feet of RG-213 type coax, and my TS-850S-AT seems to get signals out on the air. I'm often complimented about my signal strength on a morning net -- my 100 watts vs several other folks' amplifiers.

My empirical advice is to get as much wire length up as high as practical. Low isn't all bad (NVIS, cloud warming modes do well for several hundred miles (up to 500 or so for me on 80 meters)).

The only problem with SWR on lower (maybe not 10 meters) HF bands is that the rig will do a power foldback to protect itself. Any kind of tuner (L-network up to glorious transmatches) can fix that right in the shack for most folks. (Is there anyone else who read the "Reflections" series in QST about 15-20 years ago?).

I think there are two 455khz cw filters for the TS-450SAT
what are the numbers for them?

is it:
YG-455C-1 for the 500hz bandwidth one
YG-455CN-1 for the 270hz bandwidth one

YG-455CN-1 (250)
YG-455C-1 (500)

The YK-88CN-1 is the 270 Hz model if I have it right.

Check the battery. Has it leaked and ate the trace running under the
battery holder?

Did you check the tuner before doing anything to the radio?
Specifically going into the Option setting menu? If you turn on #1 in
that menu it enables a AT-300 external tuner and disables the internal
tuner.

Yes, I went into the menu and #31 was set for (on). Guess I will open up one more time, and gently, see if those connections I mentioned before are nice and snug. Thank you. KK7XE

Thank you. Never thought of that. Will check and see if the battery
is leaking. KK7XE

I just had same issue with a 450SAT that I have, radio functions great,
tuner wont tune and hold tune...
I needed to have lithium memory battery replaced at the shop and an
alignment, but that is all.

Did you check the tuner before doing anything to the radio?
Specifically going into the Option setting menu? If you turn on #1 in
that menu it enables a AT-300 external tuner and disables the internal
tuner.

Thank you Fred. yep, I might do the same. really like the radio,
and loaded with two CW filters and the SSB filter. Had one of these
rigs about 4 years ago, without the tuner. I just ordered a Palstar
so that I would have a tuner and be able to use the radio. My
antennas are a Zero Five vertical and need a tuner for that and also
have a homebrew OCF dipole/windom.
Thank you much for your time.

I turned it off, just to see if that would do anything, but with it off, that would (disable) the internal tuner if I am not mistaken....

The 850 also has a setting in the setup menu where you can use the tuner manually, using some of the knobs as adjustments while watching the SWR meter. Does the 450 have that feature?

Hi Zack. yes it does, but the tuner does not function at all. Even in Manual Mode, the tune light would come on, and it does not. I have menu item#1, off and #31, on. Nothing happening. Thank you.

Ok a little clarification.

In the extended menu where you turned on the filters the number 1 item must be off. It is for use with an EXTERNAL tuner and when turned on for use with an EXTERNAL tuner it disables the internal tuner.

In extended menu #2 item 31 must be on.

With those settings what happens?

Clif

OK, problem fixed. Thank you everyone for all the help and hope I provided enough humor and frustration for all. CN9 did have a broken wire, that upon moving it, it reared it's ugly head to show me something gone bad.

6989. Increased Power on TS450SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-11 01:31:50 UTC
From: Clif
Topic: 6989 Message: 6989

In case anyone wants to increase the power out on their TS450SAT look in the picture folder under Increased power on TS450SAT. The picture illustrates what happens when a tuner has to handle more power than it was designed for. This particular radio was putting out 215w on 20m. Needless to say it's now a plain S model. The PCB is Discontinued and the tuner is not repairable. The black area is where the board has turned to charcoal. The hole in the trace is where a coil fell out.

This applies to any of the Kenwoods with a built-in tuner.

Clif

6990. Quick TS-850 ATU Question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-11 22:22:59 UTC
From: bkimura66
Topic: 6990 Message: 6990

Greetings,
Is there any way to configure the TS-850 ATU to stop tuning at the best SWR after the first try versus continuing to tune if it can't achieve a 1:1?

Thanks,
- Bill

6992. Re: [TS-850_450_690] Quick TS-850 ATU Question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-11 23:10:23 UTC
From: johnnygm7lsi@aol.com
Topic: 6990 Message: 6992

No, but if you hit the tune button when the swr is at its lowest point it will set there

Greetings,
Is there any way to configure the TS-850 ATU to stop tuning at the best SWR after the first try versus continuing to tune if it can't achieve a 1:1?

Thanks,
- Bill

6993. Converting a TS-850 from UK to US Ham Band specifications

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-12 10:46:16 UTC
From: James Newton
Topic: 6993 Message: 6993

I am an owner/ dedicated operator of a UK standard TS-850. I have been UK licensed and resident for a number of years but now must consider returning to the US. My TS-850 is factory issue with band coverage for the UK preset.

Is there a modification which will convert the band coverage to the US standard?? For example, the full 40m coverage on the radio [old style IARU Zone 1] is 7.000 to 7.100 mhz whereas the US model's coverage would have been 7.000 to 7.300 mhz.

I know the full wide open modification is possible but I would like to retain the added out-of-band protection of limited access.

Thanks in advance
Jim m0ygw/k9ygw

Jim,

As far as I am aware, there is only the "general coverage" mod. I don't believe you can only open up certain segments.

Max,

I understand, and yet, there must be "hardware" distinction between the two configurations which creates the UK versus the US versions. The versions are the same in all other matters; functionality, features, physical features, and most interesting specifications.

I am not technically competent to ascertain the differentiating factor but cannot help but feel that there may be a diode configuration or "dip switch" setting somewhere in the circuitry which more qualified TS-850 practitioners might be aware of.

I hope someone may have an insight here. Thanks for responding and hope to work you one day soon.

Jim

I believe it would be a case of the "Type" marker Kenwood uses, such as "K", "W", etc. depending on the destination market. Normally these differences are set using diode arrays, that you clip to enable or re-connect to disable. There can also be board level differences, as well as differences in the ROM, I know Kenwood uses the diodes and, in some cases, different circuit boards.

Going through the service manual shows Diodes D-6 thru D-12 as "Destination selection", as well as showing several different Digital unit boards which also depend on the intended destination. There doesn't seem to be anything indicated with a "T" , which is the code for England, but there are some difference with a generic "M" destination... My guess is it`s a board level issue...73...Jordan...

Nope, 'fraid not Paul. I was at the Orlando Hamfest in February, I chatted
to the Kenwood rep - he tells me they are first working on a replacement
for the TH-D7A handheld, when that is out, then only will they get to the drawing
boards and design a new HF rig. He suggests it could be at least another 2 - 3
years away before we see a new one on the shelves. The major problem he says,
is that Kenwood are pumping most of their resources, time and money into
building commercial gear - because they sell 12 times more commercial stuff than
ham stuff. So, due to ecconomics - and you can't blame them, they have to go
where the money is, to prosper. We get a small percentage of their R & D time,
according to sales. It's a pity, they produced the finest equipment in the 80's
and 90's. Although the TS-2000 is still an amazing transceiver, and very well
worth the money. You can't go wrong if you buy a TS-2000 or a really good
used TS-870 or TS-850.

Yes, an excellent TS-850s or TS-870 are fine radios, even by today's standards. Their receivers are STILL competitive.

Will a Kenwood SM220 Monitor Scope work on a TS-450?
Also if it doesn't have the BS-8 unit already installed,
how hard are they to come by?

The finals are still trucking right along. About the only thing that hurts them is overvoltage. They are rated at 18v C-E MAX, so if your homebrew power supply fails and puts 20v on them they are usually toast.

your manual should tell you if the sm220 will work. any scope will work on rf output, but the bs-8 is needed for the pan to work on either model.

availability....search google, ebay, eham, qth.com and any other swaps around to check on this

checked the kenwood booklet, and it shows the sm230 for the 850 and 950, with no dot in the other models (450s included)

sm220 is actually for the 820/830 series... other than the coloring, not sure if there is actually anything different

Good morning.

Every time I reply to a message on this forum, I get a "Cannot send" message.
I thought I would send a copy of this directly to you, and you can post it (or not).

Paul - K2BK

condor@... wrote:
The SM-220 was also usable for the TS-940.

There was a world of difference between the SM-220 and the SM-230.

The SM-220 could also be used to tune linear amplifiers via a two tone output and a trapezoid display, a RTTY tuning aid (with crossed ellipses) , and a standard X/Y oscilloscope.

The SM-230 was just a band scope with dual trace abilities - the lower trace covered ~100 Kcs or so of band, and the upper trace covered a adjustable smaller section, down to 5Kcs (IIRC), and was designed for the TS-950 only. This dual trace functioned like a standard dual trace scope, with the smaller trace on the top highlighted by a brighter section of the lower trace - this feature only worked with the TS-950 using a special cable.

When used with the TS-850, only a single trace can be seen, and it used a single RCA cable.

Paul - K2BK

ve3wej gmail wrote:
checked the kenwood booklet, and it shows the sm230 for the 850 and 950,

with no dot in the other models (450s included)

sm220 is actually for the 820/830 series... other than the coloring, not sure if there is actually anything different

I differ with K2BK. The SM230 is a much improved SM220. It has a much
better pan adapter and can be used as such with any radio that can use
a SM220, with not add-ons needed (IE BS5 or BS8). It has a 2-tone
generator. It will function as an 'scope. It has RTTY mark and space
inputs. The only thing it doesn't have is the capability to check the
linearity of an amplifier but does have the ability to monitor the
transmitted signal thru a pick-off point.

From: Brian
Topic: 7012 Message: 7012

Hi All,
I am new to this group and new to the TS850sat.
For the last week I have had a TS850sat sitting on the bench next to a IC746Pro and have to make a choice, at the moment, whatever signal I can pull out of the QRM etc with the Pro the 850 can do the same, the 850 is going to be the keeper.
I have checked out the battery, perfect, also checked for leaky cap's, all clean, everything is so clean in fact I don't think the fan has ever turned.
This is in the 3mill serial number, is there anything else I should look for ????
G4ZLP offers the IP232 interface, will this plug into the back and work or is there an optional extra needed within the rig ????

Hello Brian!

the G4ZLP Kenwood CAT Interface is all you need to hook up to a computer. I just received one, excellent quality and reasonable price.

I recently picked up a very clean 30 mil TS-850S. Not a mark on it, appears to have never been used. I am very happy with it. I installed a pair of Inrad 400Hz IF filters and a 250 Hz IF filter. Backup battery and CAR board caps all "OK" at this time in mine as well. I will change the battery anyway, 5 year life span for them.

If I want DSP noise reduction I hook the audio to a CLRdsp and a SCAF-1, than to a powered speaker. Most excellent to listen to. Better audio than what I heard out of my Orion II, and without the constant dialing looking for the audio sweet spot. At least for me it is. Much prefer the feel of the rigs before software driven mistakes showed up on the market to waste my money on.

Have fun!

Brian,

Tough choice. What the 746PRO lacks in receiver quality, it makes up for in band coverage. If you plan to do any VHF SSB work and keep the 850, you will need another 2m rig, unless you already have one. Downside to the the HF/VHF/UHF all mode rigs, is..if it is the only rig you own, and it needs to go to the shop for repair, you are off the bands 100%. With a separate rig, at least you can stay on the air somewhat. I would go with the 850, pick yourself up an older Kenwood TS-711 2m all-mode for the VHF activity.

73,
Max

>i ordered just one for the 850 as i wanted to make sure it would do
>the job before i got 3 more for the other 850 and two 950's. here is
>what i have found in the past two weeks as i have been setting up my
>stations for computer operation after years of not doing so. hihi..

the ZLP interface with the 570 and DXLAB suite of software works
great. there is a learning curve to the software setup but i can not
use it of rtty psk and cw note on the cw it does not decode cw but
you can send keyboard cw if you want. since i use a bug for cw i do
not use the keyboarding but wanted to see if i could get it to work.
what you will need to do if decide if you want FSK or AFSK . the
AFSK is the EZ way to go all you need to make up is two cables (you
can get them from ZLP) one takes the audio from the speaker jack on
the back of the radio to the line in on the sound card. you will need
to take a 10k and 1k resistor and put them in series to ground and
tap the audio off between the two resistors to keep from overdriving
your sound card. you could make yourself a small box with a variable
pot and tap off the center lead. the other lead will take line out to
the mic in and mic sheild pins on the mic jack on the radios front..
i have tried to use the 13 pin DIN plug on the back of the radio but
the pins are dead till you switch pin 9 to active . i just have not
had time to build a interface to do that. ZLP's interface will work
with Hamradiodeluxe dxlab and n1mm software.you just have to decide
what you want to do with the software.
1 HRD rig control sat log and psk dx cluster
2 N1MM rig control contesting dx cluster
3 DXLAB rig control rtty psk cw logging dx cluster prop path
grayline call sign lookup

so the bottom line is that with the ZLP and the 850 you will still
need to make up two cables one for audio in and one for audio out. to
decode and send cw you will either have to use a digi keyer or a
pk232 pk900 kam ect. also for fsk you will need the pk or kam. i

think some of the guys have gotten fsk to work with their soundcards but i have not as yet. one think to keep in mind the new computers either do not have a serial port or only have one and two ports are ideal for all of this. you can use the printer port for the digikeyer and the pk/kam but i have not gotten that far as yet. hope this has been of some little help. keep us all informed as to how it is going. of course i may have made a mistake or two in this email as it is very early in the morning here in KY and the coffee is not yet ready . so boys if i have please correct my mistakes so Brian can get the 850 up and going

Hi All,
Many thanks for all the good info, great stuff.
I will have to sort out Filters in the future but at the moment will see how it goes with the standard Kenwood ones, and once I get used to using the Slope Tune.
I use logger32, and have done so for years,I will use the ZLP, then transfer my home brewed interface over to the ACC2, and hope I strike a good day with no shaky hands.
Just one last question at the moment, I have the PS-52, are they capable of running FSK RTTY for extended periods, like doing the odd contest ????
I wont miss 2m, we have no one to talk to here on that band, and 6m is also off limits owing to the TV channels.
73 and thank you all
Brian

Brian,

I use mine for most of the RTTY contests and have no problem running 100W for extended periods of time. I use a home brew well regulated 40A supply so I have no concerns about the power supply. The 850 has never missed a beat. They are great FSK radios.

7023. Antenna Tuner Problems

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-04-23 18:28:47 UTC
From: carl.bohman
Topic: 7023 Message: 7023

Hi,

I have a TS-450SAT. The antenna tuner isn't quite working correctly.

If the match (SWR) is close, then the tuner will tune.

If it is off, if I keep starting and stoping the tuner it will eventally tune. While tuning you see forward power and reverse power on the bargraph meter, but after a split second you then see the forward and reverse power go to 0, nothing.

This radio when I received it was adjusted for more RF output, 150+ watts. I have since readjusted per service manual spec.

I removed the tuner and can see no obvious defective or blown parts. Can anyone make some suggestions where to begin? How do you troubleshoot, in or out of the radio?

I do have a TS-690SAT and have duplicated the problem with the tuner in the TS-690SAT and have put the tuner from the TS-690S into the TS-450SAT and verified that the radio and interface are working correctly.

73,

Carl - W9PMZ

sounds like you verified the 450's tuner is bad......seen this before asked on this group, maybe searching the archives, if no one gives you an answer.

Subject: [TS-850_450_690] Antenna Tuner Problems

Hi,

I have a TS-450SAT. The antenna tuner isn't quite working
correctly.

If the match (SWR) is close, then the tuner will tune.

If it is off, if I keep starting and stoping the tuner it will
eventally tune. While tuning you see forward power and reverse power
on the bargraph meter, but after a split second you then see the
forward and reverse power go to 0, nothing.

This radio when I received it was adjusted for more RF output, 150+
watts. I have since readjusted per service manual spec.

I removed the tuner and can see no obvious defective or blown parts.
Can anyone make some suggestions where to begin? How do you
troubleshoot, in or out of the radio?

I do have a TS-690SAT and have duplicated the problem with the tuner
in the TS-690SAT and have put the tuner from the TS-690S into the TS-
450SAT and verified that the radio and interface are working
correctly.

I was browsing e-bay the other day and note that someone there seems
to have a TS-850 he is selling as pieces (or maybe a couple of them,
or maybe he was a servicer) You can check it out, as I recall seeing
the ATU for TS-850 among his pieces and parts.

That is probably Fred, N8BX. I have purchased TS850 parts from him in
the past. As you can tell by his photos, everything is like new and is
in great shape.

Hello,

Is any way to control power out on SSB? No MIC gain just power out.
On CW is easy with PWR and CARR knob.

Thanks

The Power Knob. In a properly aligned 450/850 it adjusts from 10-100w.

also, if you decrease the mic gain, your output will be reduced, but so will you audio level from your mike...

the power control knob is a better choice....

Steve,
Sorry for not posting sooner.I can't help with finding a new memory encoder, but I was wondering what the problem is with yours? I had a problem with mine, and Bill, K0ZL, recommended trying Cailube MCL (Moving contact lubricant) in it.Mine was working erratically, jumping channels, etc.A couple of quick squirts down the shaft, rotate it a few times and everything was back to normal.Since I did this, the product has been renamed "Fader Lube", but it's supposed to be the same.I tried finding it locally, but no luck, I had to order it direct from the manufacturer. Try www.caig.com .
Hope this helps,
Al
KJ5GT

7038. TS 690 Distortion on receive and transmitted SSB audio

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-01 15:12:39 UTC
From: vcrmstr
Topic: 7038 Message: 7038

Hello all,
For the past fifteen months that I have been the owner of a TS 690. I have been happily lurking on the group reading about all the problems and joys of owning the TS 450 & 690 series rigs. Mine has been one of the best radios I have ever owned, until a few days ago. I noticed distortion on some of the signals on a 40m net I am on daily. I chalked it up to my old Radio Shack DSP. When I disconnected the DSP the distortion was still there. So it was attributed to band conditions. When it only got worse, and other ops were commenting on distortion on my transmissions, similar to RF getting into my audio I realized I was in trouble. We have tried removing the DSS board, and re-soldering the R to R pack contacts, no improvement. The distortion seems to get more noticeable daily. Any help would be greatly appreciated, as my I found my backup rig has a badly drifting VFO and this has put me off the air :(
73
Fred
N7FK
I do have a copy of the service manual.

Does it do it on all bands?

If so, try step 7 in PLL adjustment. The trimmer becomes intermittent
and causes problems. Give it a few spins and then set it.

Do you have it connected to a tnc or modem on the rear din ?

This does cause distortion on voice transmisions. There is a mod
out for this problem on mods.dk
Probably not the cause, but a possibility, it happened to me some
10 years ago

If anyone is looking for one of the newer CAR boards with the 66312
DDS chips, Fred has one for sale on QTH.com. Here is the link to his ad:

http://swap.qth.com/view_ad.php?counter=662967

These are getting hard to find. The chips alone went for $28 each when
you could get them. I have bought from Fred in the past and everything
is 100% as he states.

Tom

That is true of possible distortion on RECEIVE signals if the gain of
the noise
blanker is turned too high. However, Fred is complaining of distortion
on
his TRANSMIT signals......and the noise blanker would not be
responsible for
that.

Hi Tom,
I took a look ans the noise blanker is off. Thanks for the help!

Hi Again Group,
It seems after re-soldering the DSS board and cleaning it with alcohol, returning it to the rig and waiting for it to completely dry, the situation is resolved! Thanks to all who took the time to suggest solutions, they were all greatly appreciated. This is a great radio and I am glad to have it back on line!

7048. TS-850 Battery Change Questions

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-02 18:29:31 UTC
From: dsh_0403
Topic: 7048 Message: 7048

I have two questions regarding the TS850 battery change.

1. I have disconnected the cables with conventional connectors that need to be disconnected from the Digital Unit PCB to lean it forward, and I am left with one ribbon cable at CN9 (upper left) that has to be disconnected. I have worked with similar ribbon cables before and there has always been a friction type lock that you pull out to release the cable from the connector. This does not appear to have one. Am I missing it? What is the proper way to release the cable from the connector? All the "How-To"s I can find on changing the battery only say "remove the ribbon cables".

2. It appears that there is enough room between the back mounting plate of the Digital Unit PCB and just to the left of the fan to mount a small covered "AA" battery holder. Is there any good reason why I would not do that instead of replacing the existing battery with another button battery and holder. I have measured the voltage of the two "AA" cells and it is 3.15 V which I suspect is a little higher than a button battery but I would not think it would be a problem. I am by no means an expert though and I would welcome any opinions.

Thanks.

The ribbon cables are a friction mount just pull them out. As for the battery I moved mine & 2 others to the area that you said with a button cell and holder. The button cell will last 5+ years and the AA's will last aprox. 1.5 years. I would use the button cell because it is much smaller and lasts alot longer.

The ribbon cable simply pulls out from the connector. When you put it back in, I find it best to wiggle it back in and make sure it is seated completely in the connector. Make sure it lines up straight.

Obviously the main issue with the battery is when it leaks, it will leak corrosive material onto the circuit board and eat through the traces. So you have to ask yourself why would you want to take that chance again? I also see many people mounting the new battery down near the fan. This makes no sense to me as you still have to remove the top cover to replace it. I salvaged a battery holder from an old computer motherboard and put my battery in there and mounted it under the hatch on the top cover. This way when the battery needs replacing I simply open the hatch and there it is. Takes about 15 seconds. I new battery should measure in the area of 3.3V. I wouldn't think a set of AA cells would last anywhere near as long as the coin type battery.

Max

You were right. It easily pulled out. All it needed was a little
courage.

With regard to the type of battery, what you and Max said makes a lot
of sense. On the other hand the "AA" holder is here and a solder-in
button holder is over an hour of driving away at a RS store, and the
preferred one with leads would have to be mail ordered. At this point
I think I will go with the AA holder for now and place a mail order
for a button holder with leads to place under the cover when I have
enough other needs to make the shipping costs worth while.

Thanks to both you and Max for your help and suggestions.

Hi Guys,
Well my 690 decided to go back to its old tricks in the middle of the high noon net I was calling on 40m today. In the immortal words of Bill Bendix " What a revoltin' development this is!" there anyone on the net who has parted out a ts-450 or 690 that has a DDS board they would part with? any help or ideas on changing the chips would be appreciated!

The DDS chips have more than one purpose....I suspect you have a "bad" trimmer cap, and/or leaky DDS board caps. My 450S worked fine for well over 15 years before I first ran into the same problem and I also suspected DDS problems, but using the service manual I was able to determine that all of the functions the DDS IC's are supposed to perform, such as carrier generation for CW and SSB etc., were being performed.

Next time you're inside the rig and have access to the DDS board and the carrier board trimmers, one by one give them a very short ,quick blast of Freez-It or other electronic 'freeze' spray and you'll notice the 'bad' cap as soon as you hit the right trimmer. Then soak up some De-Oxit or similiar on a Q-tip (Cotton only) , and then touch the Q-tip to the head of the capacitor so that a small amount flows onto and into the cap.

Then give the adjustment a gentle turn or 6 to break-down the tarnish/dust/oxidation in the cap contacts. This procedure works for me 99% of the time when these caps go flaky.
Unless there has been actual physical damage or a punctured dielectric, there is little that can actually fail in the capacitor assembly.
A second receiver tuned to the LO you're trying to adjust will allow you to actually hear the cleaning action as the signal goes from being rather 'scratchy' to being very smooth as the cap is rotated... I'd then suggest doing at least an alignment of those circuits.
Other problems should show up as you go through the alignment procedure.

Good luck and 73.....Jordan....

Anyway, in my book it's worth the cost of the effort

7057. TS850SAT frequency hopping

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-04 19:19:22 UTC
From: on7eh
Topic: 7057 Message: 7057

Hello,

I ran into an annoying problem with my secondhand Kenwood TS850SAT. (of US-origin)
(I already had the "dots in the display"-problem but this is solved...)

What happens?
After some time, the VFO-frequency jumps away from the wanted frequency. (as does the effective Rx-frequency)

Example: the VFO is set to 14.203.
After some time, I'd find the frequency indicating 14.210. (It seems this changed frequency is always rounded up)

This happens to both VFO A and B.
For the time being, I use the F. LOCK-button to freeze onto the wanted frequency.

BTW: I'm using this rig as IF for 2m operation behind a transverter. To attain good frequency accuracy, I sometimes leave
the rig switched on for 1/2 hour before operating the rig. It was after such "warming-up" periods that the artefact was noticed...

Any help is welcome!
Thanks a lot!

Michel, ON7EH

Michel,
That looks very much the same that my TS850 had a couple of years ago.
Mine had a leaking battery which damaged the board. Replaced the battery
and repaired the board. Ok since! Good Luck.....

7059. Replacement RF Relay/Surge Protection board for TS-850S ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-04 21:06:58 UTC
From: n4pl@netscape.net
Topic: 7059 Message: 7059

Dear All,

My friends at SP5KCR (a club station in Warsaw) had an unfortunate mishap with their TS-850S which took the T/R Relay/Protection board, part number X51-3100-00-B/3. The board is beyond repair. I called Kenwood Customer Service and learned that replacement boards are no longer available. Kenwood recommended that I look for someone parting out a defective TS-850. So here I am... could anybody help out? Any clues/hints are highly appreciated.

Many thx and 73,
Wald N4PL

7060. Receiver sensitivity problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-04 21:38:50 UTC
From: Oz
Topic: 7060 Message: 7060

Ok, took me a long time to answer Cliff but I just finished finals at school.
I had asked if anyone could point me to where to begin to look for sensitivity prob in higher freqs (TS850SAT). Now I tested and the desensitivity starts off gradual at about 8Mhz to 8800Mhz where it remains attenuated at about 20 db and it remains diminished up to the high end or 30Mhz.
Transmit power is fine across the spectrum. I do not have a rf sig gen so I can't give specifics. I did change all trimmer caps and aligned fine and stable after changing them. I was hoping it was that but at least it fixed my transmit audio prob.
Rig works like a dream on 75 and 40 and I suspect 160.

7062. Proper way to run QRP

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-05 02:17:05 UTC
From: Sam M
Topic: 7062 Message: 7062

I have a TS450SAT. The manual says to run the PWR at maximum clockwise.
Then for CW to use the CAR knob to adjust the power out.
and for SSB to adjust the MIC knob to adjust power out.

Is the above the proper way to run the rig at say 5w cw?
or should the PWR knob setting be reduced and the CAR increased?
or does it matter?

Same question for SSB should the power out put be adjusted for 5w
by turning the PWR gain down and the MIC gain up?
or does it matter?

they say maimum for maximum output, yes turn the knobs counter clockwise to decrease the ouput.

Michel,
That looks very much the same that my TS850 had a couple of years ago.
Mine had a leaking battery which damaged the board. Replaced the battery
and repaired the board. Ok since! Good Luck.....

Subject: [TS-850_450_690] TS850SAT frequency hopping

Hello,

I ran into an annoying problem with my secondhand Kenwood TS850SAT. (of US-origin)
(I already had the "dots in the display"-problem but this is solved...)

What happens?
After some time, the VFO-frequency jumps away from the wanted frequency. (as does the
effective Rx-frequency)

Example: the VFO is set to 14.203.
After some time, I'd find the frequency indicating 14.210. (It seems this changed frequency
is always rounded up)

This happens to both VFO A and B.
For the time being, I use the F. LOCK-button to freeze onto the wanted frequency.

BTW: I'm using this rig as IF for 2m operation behind a transverter. To attain good
frequency accuracy, I sometimes leave
the rig switched on for 1/2 hour before operating the rig. It was after such "warming-up"
periods that the artefact was noticed...

Any help is welcome!
Thanks a lot!

Fred

Have a look at my 950 page

http://homepages.ihug.co.nz/~jaking/TS-950sdx.htm

Your problem sounds similar to the scratchy audio.

Try resoldering resister packs if the 690 had those.

As you will see you can find culprit with an ohm-meter

Yours sincerely

ZL4AI

SSB audio

Hi Guys,
Well my 690 decided to go back to its old tricks in the middle of the high
noon net I was calling on 40m today. In the immortal words of Bill Bendix "
What a revoltin' development this is!" there anyone on the net who has
parted out a ts-450 or 690 that has a DDS board they would part with? any
help or ideas on changing the chips would be appreciated!

Hello all,
For the past fifteen months that I have been the owner of a TS 690. I
have been happily lurking on the group reading about all the problems
and joys of owning the TS 450 & 690 series rigs. Mine has been one of
the best radios I have ever owned, until a few days ago. I noticed
distortion on some of the signals on a 40m net I am on daily. I
chalked it up to my old Radio Shack DSP. When I disconnected the DSP
the distortion was still there. So it was attributed to band
conditions. When it only got worse, and other ops were commenting on
distortion on my transmissions, similar to RF getting into my audio I

realized I was in trouble. We have tried removing the DSS board, and re-soldering the R to R pack contacts, no improvement. The distortion seems to get more noticeable daily. Any help would be greatly appreciated, as my I found my backup rig has a badly drifting VFO and this has put me off the air :(

From: MM3XXW
Topic: 7066 Message: 7066

Hi all,

Newbie to both the Group & ownership of the TS450SAT so I hope you'll bear with me!

I do have one specific question however and I hope someone can throw some light on the problem.
I use the MC60 (not the 60A) with the 450 and have received reports that the audio is very quiet, not distorted or anything like that simply quiet, resulting in me practically having to swallow the mic which is not really condusive to good rag-chew!
I have adjusted the mic as per manual instructions so I wonder what I may be doing wrong and is there an easy fix?

Thanks in anticipation.

Martyn

Hi Martyn and all,
Please give us more informations about your configuration :
Are you using processor ?
Concerning microphone : preamplifier, impedance 50k or 500 ohms ?
With my ts850 : without processor, mc-60's preamplifier and with 500 ohms,
the audio is good but low too.
I use it with processor at 10 db, mic gain on 5, preamplifier in function
and impedance at 50 Kohms (and 500 ohms with dsp-100)
Regards
Allan

7068. Low audio output

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-07 20:08:00 UTC
From: MM3XXW
Topic: 7068 Message: 7068

Hi Allan & all,

The mic I use with the TS450SAT is an MC60, the one without the amplifier stage, with the impedance set at 500.
After setting up the audio via the ALC, as per manual instructions, and incorporating the processor I'm still getting reports of a low (but clear) audio if I'm much more than 2cm away from the mic (most of the time I'm practically swallowing the damn thing!).

I'm thinking that maybe one of the previous owners has been fiddling with a screwdriver in and around the VR's and hasn't got it quite right!
The signal strength reports are OK despite the poor conditions but it's just a wee bit annoying not being able to get the audio just right.

Any ideas?

Regards,
Martyn

Martyn,

I don't think there is an internal adjustment for mic gain, only forward power. What does the output show in CW or FM mode on an external meter? Have you tried another microphone?

7076. TS-790A progress

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-13 17:05:44 UTC
From: Jordan
Topic: 7076 Message: 7076

I finally found the time to get into the TX section of aligning my TS-790A....
Prior to alignment the output per band was as follows:

144.200 - 24 watts --- After align't 144.200 51 watts (~+3dB)

432.100 - 27 watts --- After align't 432.100 53 watts (~+3dB)

1296.100 - 9 watts --- After align't 1296.1 14.5 watts (~+2dB)

Obviously well worth the effort, and within specs now for the devices used.

I had my first EME qso on JT-65B with HB9Q and their 15m dish @ 1Kw RF on 432.070.
The TS-790A was barefoot to a K1FO-25 ele yagi at 40ft and a Landwehr M-M preamp. It was a spur of the moment contact, as I saw him on the JT65 logger and went to see if I could hear anything from him , and he was actually pretty loud @ -14.....

I have yet to receive info on the S-Meter scale on the TS-790A sub receiver.... The S-Meter itself works fine, but the S scale below the meter is almost invisible unless lit from the front by an external light source.... Should this scale be illuminated , or is this normal...?
All the bulbs I can find are lighting normally, but I wonder if there is a grain of wheat bulb or two mounted somewhere I can't seem to find.....Any thoughts or ideas on this...?

Martyn,

Search back through the list. This has been discussed many times before. Usually if you subtract 2 from the first number, it tells you the year of manufacture. For example, a 70,xxx,xxx would tell you it was made in either 1985, 1995 or 2005. Of course you have to use your head a bit to know what the production dates on the particular radio were.

Eg. The TS850's were made from 1991 to 1996, then replaced with the TS870. So it couldn't have been made in 1985 or 2005. That leaves 1995. Hope it is clear.

Martyn,

Search back through the list. This has been discussed many times
before. Usually if you subtract 2 from the first number, it tells you
the year of manufacture. For example, a 70,xxx,xxx would tell you it
was made in either 1985, 1995 or 2005. Of course you have to use your
head a bit to know what the production dates on the particular radio were.

Eg. The TS850's were made from 1991 to 1996, then replaced with the
TS870. So it couldn't have been made in 1985 or 2005. That leaves
1995. Hope it is clear.

7082. PA7TWO KWD-TS850Sat terrible smell after short transmit

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-13 21:51:26 UTC
From: pa7two
Topic: 7082 Message: 7082

Dear all,

I have a phenomenon I am not able to find the root cause. When I switch-on my KWD TS-850Sat and do a few short CW transmissions, the internal fans starts and from the back of the radio I sense a terrible smell, like rotten eggs.
I checked twice all PCBs (found some capacitors leaking, but this was in the tuner section and not causing this smell).

I double checked the C1 on the CAR PCB, printed in black color and not leaking.

Has anyone experienced this before? For the rest the radio performs as did does for years, 100% OK...

Looking forward to your replies on the matter,

Vy 73, de Kees - pa7two

I was aware he was asking about the 450. I don't see why Kenwood would do it two different ways considering the rigs were both being produced at the same time.

Hi Dave,

I am not joking... When I hit the CW paddle 1/2 minute later the
terrible stank is in the shack...

I wonder, could it be the C1 on the CAR board without able to see if
this capacitor leaks? The C1 looks OK to me...

I am not an expert in electronics but "rotten egs" sounds for me like
any kind of sulphide compound.
An old grease (butter-type) would be my second guess. Is there any
chace that someone used eg. butter to lubricate the fans? It might
sound sutpid but ...

Best regards!

My money is on C1 on the carrier board. The TXB line goes under it and when it leaks it shorts it to ground and you get the smell. Keep keying it and it will take out the Tx/Rx board on the IF unit.

Hi Clif,

Thanks for the tip! I think this very same thing has happened to my TS-850SAT. I had traced it back to the transistor on the TRX sub-board (which is in turn on the IF board) which turns on TXB. It got so hot that it melted right off the board on two terminals. I soldered it back in and the TXB signal turns on again, but only to 4.8 volts or so, and the transistor is very hot in a hurry. So something is drawing a ton of current from TXB. I did that tracing last night, but didn't get to figuring out what cable/s took TXB off the IF board to start isolating the "leak." I'll check C1 on the carrier board to see if it is the culprit tonight. You may have just saved me a lot of hunting for the "leak."

73,

Rob, KL7NA

Hi Clif, et. al.,

You were dead right on the C1 leaking and shorting out TXB. Way to go Clif!

I still have a problem though. Something on the TXB line is putting 0.88 volts on it during receive, which doesn't allow RXB to turn on to 8 volts. If I short TXB to ground, there is 30 mA that flows through the short and RXB comes on and the receiver appears to work fine. The problem I face is that TXB goes to a lot of different places in the rig, and figuring out which one is putting the 0.88 volts on the line during receive is very tedious at best. Does anyone have any ideas on how best to chase this down?

When the problem was still intermittent I found that cycling to transmit and back to receive would often get it receiving again. Now, it appears to be pretty solid not receiving (unless I ground TXB).

Thanks & 73,

Rob, KL7NA

Hi Everyone,

One more note. I don't think it is the Carrier board putting the 0.88 volts on the TXB line, as I removed the white ribbon cable that TXB comes in on and the 0.88 volts remained. I forgot to note that in my previous post.

73,

Rob

Hi All,

I found some notes on the web at:

http://www.cqham.ru/ts850repair.htm

Those suggested it might be D31 and it was!

Thanks everyone for the tips!

73,

Rob, KL7NA

Topic: 7082 Message: 7097

Hi to all,

Thanks for the great response, I was able to find the culprit!

The next day I examined again the CAR PCB and I observed some electrolite acid on the PCB just under 4 of the capacitors... Too late, because it damaged some of the traces :-(

I repaired the PCB lot by replacing the original CAPs by a ordinairy type capacitors (10 x 16v/10uF and 1 x 36v/47uF) which all fitted exactly in the original plastic sockets.

My hint to all who did not do this exercise yet : REMOVE ALL CAPACITORS on the CAR PCB!

Anyone has an idea what to put on the green soldermask that has been damaged by the acid? I have removed the bad parts, shiny copper is displayed now... have to covered by something I suppose.

Again, THANKS for all the comments en observations!

Vy 73, de Kees.

Hi all,
I have a TL-922 that I use with the TS-850. I just bought a TS-2000 and can someone please tell me if the remote connector of the TS-2000 is the same as the TS-850 ? .
Thanks and best 73ss

Yes. I had/have both and Kenwood has kept the same connectors.

7101. TS-850 ACC1 CAT PORT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-20 20:38:53 UTC
From: g3liv
Topic: 7101 Message: 7101

I have been trying to fire up the CAT port of my TS-850SAT
I have tried most of the usual circuits knocking around and
have been using HRD control.
But it always FAILS to connect.

My IC-706Mk11...FT-857...FT-900 are all fine using CAT.

Has anyone had trouble with the actual ACC1 being faulty ?
When I use HRD I can never switch DTR into the ON position.

I can check the BOX ON in the set up. But when it Fails to connect.
It still shows DTR OFF.
Even when the DTR set up box is ticked in HRD.
Is there a BUG for the 850 ?

Am I missing some thing some where.
I am no beginner at this and now kind of think the ACC1 is faulty.

Its never been used in the 12 years I have had the 850 from new.
Any ideas ?

Are you using a TTL to RS232 converter circuit? If so the 4800,8,n,2 should work just fine. A cat cable for the Yeasu will not work for the Kenwood. Also chek to make sure you have the correct com port selected.

Hi Dave,

Thanks for the reply.

I have been trying it with HRD as a control program.

On both 4800 and Auto.

I do have the External Control Manual.
But I am not sure what you mean by.....

Verify it is turned on as per the external control
manual for the TS-850.

Or that you mean check the MENU in HRD.

Do you mean it is possible that the CAT input on the TS-850
is in fact turned OFF or am I just misunderstanding the statement.

Again tks,

Also, depending on how your TTL to RS232 voltage level converter
circuit is constructed, you may need to set RTS on the serial port
to "Always on".

Hi Rich,

Thanks for the come back.
I cant get any where with this.

I have tried for a long time now to get this going but no
further forward.

Yes I understand the CTS/RTS/DTR situation.
But DRT will NOT SET ON within the HRD set up.
Click the box ON and it still shows it OFF when the
failure report comes back.

I have on VE3 telling me that within the 850 there is a MENU setting
to switch the Cat port on or check its settings .
But I can see no way of doing that and I have read these manuals for weeks now.

So I have just decided to give up on CAT with the 850.
And use my 706.
I just cant waste any more time on it.

But thanks for the reply.

From: g3liv
Topic: 7109 Message: 7109

Hi Guys,

Thanks for the various replys to my " HELP" request.

I have exausted all these mentioned paths now and have come to
the conclution that the CAT ACC1 is faulty.

So its time to switch to my IC-706 for any CAT control.

But I thank you all for the feedback.
Maybe one day in the future I will have a eureaka moment.

Thanks again.

de Johnny G3LIV

Maybe because Kenwood's don't speak "Cat". That's Yaesu's name for computer control.

Seriously though I have seen the ACC-1 port fail. It goes thru a 7404 inverter and then straight to the processor. ACC-1 is a TTL level input/output and requires conversion to RS232 levels to function. RTS, CTS, RXD, and TXD all go thru the same inverter.

Hi Cliff,

I just finally set a scope up on it last night.
And there is no sign of any activity on any of the pins
of ACL to ground when you change Freq or Modes.

I am now more under the impression its faulty.
But I was working on the basis it had never been used,
not that that is a guarantee of course.

When I get suitable time I will look at that board.
I need to get more info on that yet anyway. as to location etc.

But Tks

It so happens I have an 850 on the bench now. I checked the lines going to the ACl and saw no activity when turning the main encoder. I then hooked up an IF232 and then to my computer running HRD. It connected immediately and worked fine.

Are you ABSOLUTELY sure the cable you are using is straight thru and not a null modem cable. What are you using for level conversion?

Hi Clif,

That was handy it was available.

Strange, I expected to see some activity on the ACC1 lines.
We live and learn.

I just knocked up that circuit from the HRD interface list as
recommended for Kenwood's.
The one by IK2BCP with the 2 optos .
I know my COM1 is ok as I use it for Data modes and although
I have not checked out ever pin on it, it usually does do what's required.

I did just try a USB/RS232 adaptor cable with the same results.

I have a contact in Kenwood UK and he is posting me up an
old IF232 to try that out before I go any deeper.

It will prove one way or another if its ACC1 or the generally used
circuits recommended for the Kenwood's.

I did email IK2BCP regarding the circuit. The reply was that
its fine for Kenwood's. But no other comments.

I will keep the group informed as to what I find.
Its odd that I have had no trouble on 3 other rigs getting CAT going.

The wiring to the 9 Pin Coms port is hard wired just now.
But I understand what you mean regarding that statement,

Again thank you for taking this time out to reply.

Hi Again Clif.

I am using the Coms port to power it.
Volts seem to be in right places.

One nice thing is the circuit did not need external volts supplied.

I have an IC-232 hopefully on loan coming next week.
I think that will prove it one way or the other.

Tks again

Hi Clif,

It may well be the interface.
But I chose it because its published in the HRD interface advice pages.
I emailed the designer to be told its fine for my TS-850.
Its the design by IK2BCP in the HRD listing under Kenwood CAT Interfaces.

I use COMs driven interfaces for my 706 and 857,
They work fine.
But the IF-232 will kind of prove that one way or another when
I receive it , I hope next week.

Thanks again
de Johnny G3LIV

7121. TS 850 Squeak in AT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-23 21:25:35 UTC
From: Robert Hunter
Topic: 7121 Message: 7121

I have my 850 open trying to gain access to the Ant Tuner motors, they are squeaking bad. Looks like major disassembly. Any tips?

Looks like I have to unsolder some cables to slide the cover out of the way.

I have had this rig since new and this is the first problem. Mostly use for contesting with the amp so it is bypassed. Batteries are original but look fine but they will get replaced soon.

Bob NG2P Rochester NY

Hi Bob

I have had the same problem with my 850, also bought it new in 93, and it started squeaking bad last year. I also took the cover off and decided not to fiddle. Perhaps a good clean out with compressed air would help....I look forward to some replies from guys that have cured that squeak. My tuner still works well, just an annoying high pitched squeak.

Most of the noise come from motor shaft boushing .
Just remove the tuner from Ts-850 .

Remove the tuner cover .
Drop some light oil on the motor shaft bushing .
Drop some oil on moving gear and shaft .
My 3 ts-850 had the same problem and was fixed the same way .
Dont need to tear down the unit .
Only screws , few wires and cables to remove .
Easy job .
Will tune like new .

Just an update on the squeaky AT motors repair.

The hardest part of the job was gaining access to the interior of the AT motor shaft compartment. At least the covers on my AT were not as easy as it was made out to be. The cover over the motor end came off only with some delicate prying. There were some nipples on the cover that prohibited easy removal by sliding.

Once opened I propped the AT upended and held by a Pana-vice, put a drop of 3 and 1 oil on each shaft, left over night and then cleaned up the excess with q-tips.

Walla, now quiet.

Thanks for the feedback guys.

You might give Neal, G4ZLP, a call. He sells some cables for CAT on the
Kenwoods and he once sent me the voltages that should be on the ACC plug.
It would be easy to check them out. 73

Dear all,

Could it be that there are more of this leaky CAPs in the TS850 like
on the CAR PCB (Which I all replaced) ?

Still every time when I switch on the radio I smell the stank...

Much less in strenght, sure, but still present... Any ideas please?

7128. KWD PS-53 question PA7TWO

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-29 21:12:49 UTC
From: pa7two
Topic: 7128 Message: 7128

Dear all,

Recently I bought a KWD PS-53 PSU. I hooked the PSU up to the KWD TS850 and I observe the PSU to become pretty warm (almost hot) when the radio is just in RX mode and occasionally make a very short CW QSO.

I raised the voltage inside the PSU to 14.4 volt, to make sure the KWD TS850 gets high enough voltage under load.

I also added some very small amount of heatsink paste under the temperature device, but fan does not kick in earlier... (The fan normally does only kick in during TX mode.)

Anyone can please tell me of the units get pretty warm during RX mode or something bad in my unit? (My KWD PS-52 PSU stays much cooler.)

Would like to hear your findings,

Thanks in advance,
Kees - pa7two

Hello Kees!

my TS-850S does not get "noticeably" warm during receive. Even during transmit it does not get very warm, usually at 50 to 80 watts CW. I'm using 13.9v from an Astron RS-70 amp supply.

Check the IF unit around the audio amp. Those caps have been known to
leak.

Hello Ken,

Thanks for your reply, but I am talking about my KWD PS-53 unit that
does get pretty warm, not as such the radio itself...

Do you have a KWD PS-53 unit?

Cheers,
Kees

Hi Clif,

Could you please indicate where to find this PCB in the KWD TS850?
Near the CAR PCB or?

Cheers,
Kees

Hi Clif,

Let me rephrase my question: Around which components on the IF board
shall I look for these specific CAPs? Top or bottom when facing the
front of the radio to me? Bottom of radio side or top view?

73, de Kees

Kees,

guess I didn't read your PS-53 post very well - "HI!" I was thinking of the TS-850S smell post and had burning caps on my mind.

No, I do not have a PS-53.

Hope you get the problem(s) figured out. Would be a shame to have a TS-850S not usable.

Have a great rest of the week and upcoming weekend!

Ken, KA0W

Hello Ken,

Thanks for your reply, but I am talking about my KWD PS-53 unit that

does get pretty warm, not as such the radio itself...

Do you have a KWD PS-53 unit?

Cheers,

Kees

during transmit it does not get very warm, usually at 50 to 80 watts

CW. I'm using 13.9v from an Astron RS-70 amp supply.

Hi,
Well this my first post to the group, since I am a new owner of this rig. So recently, I read some where else, that the sensitivity of the receiver is about 20dB down in the 15m? band, especially in the middle of the operating band. Since I have no instruments to check it out, has maybe anyone realised something like that?
Second, my rig's? S/N is in the range of 30xxxxxx. Do you know if it is an early or late version?
Third, could you introduce me, which updates to do?
And finally, which? filter combination is the best for SSB operation. The 1.8 KHZ kenwood filter or using some INRAD filters combination?

73 de SV9ZP / Tasos

From: WN9D
Topic: 7137 Message: 7137

Pin 7 of the TS-850 remote connector is supposed to provide +12 VDC on transmit. Mine indicates about +4 VDC on transmit. I would appreciate suggestions.

thanks and '73,
Randy WN9D

Hi Clif,

Could you please tell me in what direction I need to search for these capacitors? Maybe the printed cap number on PCB or specific location near the audio amp on the IF unit?

Thanks a million in advance,

Vy 73, de Kees

7139. Re: PA7TWO KWD-TS850Sat terrible smell after short transmit

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-05-31 20:32:39 UTC
From: pa7two
Topic: 7082 Message: 7139

Dear all,

This is becoming a real horror story :-(I've added a folder in the files section named " Leaky_caps_repair" . Added some photos of the LF and CAR board caps.

Beside the CAR board CAPs which I all replaced, I found C187 (10v/470uF) & C182 (16v/470uF) leaking on the LF board labeled "X48-3080-00 A/5". At the moment not fully sure exact what function these caps have, though. Anyone can tell me that? Are voltages at this junction higher than 10v and could that be the reason why the CAP started to leak (exploded)?

The spot on the PCB was damaged, but trace was still OK. Cleaned with some cleaning agent (special fluid to clean a PCB).

This radio is fully loaded with these kinda CAPs, I wonder wonder wonder when the next will say bye bye and damages some of the other components...

On Monday I'll go to the electronic parts shop here in town for the parts...

In the mean time I performed the BCB mod. Photo's in the "BCB_mod section" .

Hello Members.
I have just acquired a ts450sat and very pleased with it.But the internal fans are very noisy
dose anyone have know a fix or should i change the fans?Also any ideas were i might get replacement fans.My be i could replace them with none Kenwood fans from a local suppler.Thanks in advance

John G0TIY

Hi John,

No fans, no power... Be glad adequate air is blowing inside the radio.

Enjoy your rig!

Trying to get some input on how folks are
setting there "power-out" while working Digital modes(PSK,MFSK,Ect.).
Are you using the carrier control in conjunction with the mic gain, or
just mic gain? I have the carrier knob set at 3 o'clock, and mic gain
just barely set till needle just flickers on PEP meter.(trying to keep
from any ALC movement...)
Looks like I am going to have to build a IMD meter soon, But was hoping
others in the group could share their experiences with the 850.I
actually have it hooked up side by side with a TS-570,and I am amazed
at how much better the 850 "hears",now just have to tweak
"output"settings...
(by the way,the interface is a navigator)
Thanks for everyones time....

I agree with Dave. Leave the CAR on max, and adjust the output with
the mic gain. Of course the output level of your sound card will
determine where the mic gain needs to be set. Sliders on my sound card
out are about the halfway point and my mic gain at about 9:30 gets me
about 25-30 watts output. No need for anything higher on PSK.

If you are using true FSK not AFSK you will need to adjust the CAR
control to drop your power down.

I have never really noticed, I guess, but when using the ACC jack on the TS-850S, the levels are controlled via the front panel????? I am currently using my TS-870S for digital modes and the levels are menu driven.

Hi Max et al

I have also found on my '450SAT that I can reduce the power with the carrier control, then when it is where I want it, I reduce the power until it starts to go down some more, then leave it there. That might be overkill though :-) 73

Hello all, I'll be sending my newly acquired TS-850S to B&B Tech to
get what they offer as the Full Monty, check it out on there website.
www.amateur-repairs.com

I figured I'd get this done and I should not have to worry about my
850Sat for a good long while. I'd like to hear from others here that
may have had the service done to their TS-850S. Anyone?

Hi Erik,
I have a TS - 690, which is the 450 with 6 meters added. I bought the rig used and have run the heck out of it. The only problems have been minor. I had a dirty t/r relay, had to lube the tuner because it squeaked, and had an intermittent trim cap on VFO 2. Don't listen to the naysayers, this is a great rig!

Eric, I would prefer the 450s if you can swing it. I know they are sometimes a little more money, but they have been a
very successful radio. The 440s seem to have their share of problems, but once in a while you run across someone that has
one that has had no problems. Like anything man made they can shoot craps at a time when you want one most.

Just my 2 cents worth.

Eric I have been using the TS-440S mobile for the past 3.5 years and not had one problem what so ever. I bought the rig off of EBay in exelcent condition with the box. I am thinking of upgrading the mobile as my pickup is only getting 14 mpg and need to down size the transportaion. If you are interested in a good 440 with a mobile mount. I will let mine go for 350 plus shipping.

Eric,

I have a TS-450 SAT and love it -- I got it from my father and then sent it out to be cleaned and calibrated. They also replaced the battery for me before if failed. It's a solid rig and I would recommend it to anyone as a starter rig.

Good luck and 73's

I believe it is not if a 440 will have a problem, but when. The 440 problem is not a "minor" problem. Spend a little more money and get a good used 570. Dennis W8YS

Hi Erik

I had a friend here in town who had one and it spent more time in the shop than on the air. He finally just quit using it and put it up for good. I guess it was something about how they were built--the soldering job--that made them pretty unreliable. 73

Hi,

You're talking about signal reports you get on your transmit audio,
right. Is the receiver working like you think it should, and just the
transmitter is misbehaving?

I also had problems power fluctuatios .
Like breathing
I choose the 2'methode from pa5ca
just replaced the 2 multivib transistors bij BC548 (non SMD)

http://www.qsl.net/k0bx/ts850flu.htm
http://www.qsl.net/k0bx/TS-850ALC2.htm

I took the PCB on the testbank an supplyed a DC via L605

In the original situation the oscillator was stable at 14 till 16
volt. (Did not increase more the voltage above 16 volt)
Voltage below 14 volt result in instable oscillations

Afer replacing the 2 transistor oscillator was stable from 6 volt till
16 volt

I put a picture in the foto area.

Anyone using this kit by N0XAS with their '850? If so how did you wire it up? There are several ways to do so but just wanted to get ideas of how others went about it. I want to use it to key the rig and transmit CW ID by audio output. I prefer to connect through the back of the rig. Anyone using one of these? It is an easily built quality unit for $20. Any info will be greatly appreciated.

I've had a 450 for...14 years...and am the original owner. I've also used (and worked on) 440s.

The 450 is as solid a radio as they come. Drop in some filters and it becomes a heck of Digital and CW machine. Just keep the battery happy and it will do you well. If Kenwood had just put in a keyer..but I use a Vibroplex bug...so it's sort of a non-issue for me.

Now for the 440...definitely a rig that gets the job done, but you're going to have to climb under the hood with dental picks, a soldering iron, and a VOM.

Like someone said, it's not a matter of if a 440 is going to go turtle, it's a matter of when. It's a high-maintenance radio.

I take exception to the statement they are all going to go bad. The
later runs of the 440's used hot glue for potting and were trouble
free as far as the "potting compound issue".

I got a 440 some years ago, it had the dreaded "dots" problem (VCO unlock). I took the VCO boards out, removed ALL the components affected by the contact cement one or two at a time, cleaned the cement off and in a few cases replaced the components, put it back together and re-aligned it. Very tedious and time-consuming but I haven't had that trouble with it since.

I did have a sticky relay problem for a while but it cured itself.

Clif I agree with you my 440 has not missed a lick in the 3.5 to 4 years I have had it. The only problem I have had is from a aftermarket power cord pins not being the correct size therefore causing a low voltage problem (fixed with a factory power cord). Otherwise not one problem what so ever. It is a great rig.

what does the website suggest, does it feed into mike audio (also called modulated cw, or does it plug into the cw key socket on the rig..

if it is MCW, then 13 pin is what I suggest.....
if it is cw jack, then no option available

Subject: [TS-850_450_690] ID-O-Matic Wiring to TS850S

Anyone using this kit by N0XAS with their '850? If so how did you
wire it up? There are several ways to do so but just wanted to get
ideas of how others went about it. I want to use it to key the rig
and transmit CW ID by audio output. I prefer to connect through the
back of the rig. Anyone using one of these? It is an easily built
quality unit for $20. Any info will be greatly appreciated.

Yes, MCW is what I intend to use. I plan on connecting it through
the 13 pin din, set the ID'er in repeater mode and have it ID
automatically while keying the '850. Just wanted to see what others
were doing, asking for tips and experiences. Thanks for your input.

Having successfully done the battery replacement job on my 850 and confirming that the radio still works(!) another job I'd like to do is to fix the M.CH/M.VFO knob. It doesn't 'step' through the frequencies smoothly, it kinda jumps and if I rotate it too quickly it only moves about 20 or 30Kc's.
Has anyone fixed this problem and if so do you have any tips? What is the part number of the knob?
Also, I may remove the tuner from the rig, is this an easy job?

Cheers,
Andrew

Hey everybody, I'd like to introduce myself, Tom W0EA to the group. I just picked up a TS-850s at a hamfest yesterday and I'm excited to get to know more about it and its cool features. I'm 21 years old and I've been a ham since 2003 and been using an FT890 almost that whole time. So far the 850s seems to do a great job of pulling signals out of the aether so that is certainly exciting! One thing I'd like to do is see about putting some of the optional filters in there. I am thinking maybe 400hz cw filters (I do about 90% CW) but the INRAD ones are way too expensive. I was wondering if you guys knew of a way to "homebrew" a set perhaps. I'm also planning on doing the "tuner in RX" mod since I've always wanted that and it looks super easy.

Anyhow, I think that's enough for now. Hope you guys have some info to share on the Filter front!

Thanks and 73,
Tom
W0EA

Hi Tom,

The INRAD filters are well worth the money. But one recommendation is to keep an eye out on this group and also on eBay or eHAM.net for some deals. Every once in a while some show up a little cheaper.

HI Zack et al.

Also QTH.com has a lot of them for sale. That's another good spot to check.

I had a similar problem on my TS-850 with the M.CHAN/VFO CHAN, jumping,
erratic operation.On the advice of Bill, K0ZL, I used "Cailube
MCL"(moving contact lubricant).A couple of quick squirts down the
shaft, and good as new.This product has since been
renamed "Faderlube".See: www.caig.com/.The problem might be getting
it.I had to order it direct from the manufacturer, no one here
(Albuquerque, NM) had it, or had even heard of it.

And I find that D16 - that notorious diode in the Receive path is completely missing! Is that bad? Is that basically the same as a blown up one? Also on the final amps, only one has thermal grease on it with a thermocouple, the other one is bare with no thermalcouple which I thought was kind of odd. I put some thermal grease on the bare one, but it still has no thermocouple...

Thats all the oddities I've run into so far... hopefully there wont be any more!

Are you sure you're looking at D16, it's in the output of the <500kHz
rx filter????

Thermal grease is only on the one with the temp protection diode on
it. Why put grease on the top of a transistor to couple to nothing?

No oddities so far...

I'm referring to the absorber diode on the little board near the filter board on the antenna connector. I also have pretty low RX sensitivity (only 1 or 2 signals on any band that give me s-meter deflection) though it seems my TX works fine as I have worked over 10 stations with the radio with good reports (including DX).

I have also this little problem a 2 signal on s-meter difference on my 850's RX but the TX is 100% ok.
If someone have any suggestions, many thanks,
Regards
Allan

Thanks to those who replied! I've ordered some lubricant from a
European outlet so hopefully I should have the problem solved fairly soon!

Cheers,
Andrew

7185. Looking for INRAD #95

7186. TS850sat - display problems + CW/FSK key - mods done. Any advice Please.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-12 19:30:55 UTC
From: m0ajm
Topic: 7186 Message: 7186

Hi There - wonder if anyone can help with the following please.

Like lots of the members with the TS850, the display went on mine with the usual scrambled didgets. I found that C18 was leaking just a small amount, so changed all the caps on that board. I also did the battery mod as well.

Unfortunately the display has not come back, even after a reset.

So hope someone can point me in the right direction to start looking for a solution. I have read that the Car board can give problems as well, but not sure if this is the right place to start.

Any advice would be most appreciated.
PS
Just noticed that when I touch the CW/FSK key, it gives a short beep and changes the display and Filter display. The meter side of the display is uneffected. Not more trouble I hope. Hi.

Thanks again for any input on this please.

Jerry, my display did not come back either after the cap change. I watched the well known spot for radios and parts, etc.
and purchased a display for $120. shipped. When I put it in it worked perfect.

I had a little mishap with the soldering iron while attempting to replace the cap on the first one, and wrecked the socket where the ribbon cable plugged in. I tried repairing it as good as possible, but I think that was where my problem was after the cap replacement. I hope you are able to repair yours, if, in the meantime, you have a computer, download Ham Radio Deluxe and run it with your computer. I did that for a couple weeks and it works fine. You can take the display board completely out and it will work with HRD.

73 good luck, Dave W0DLR

Aloha Jerry,

Right under C18 (not the solder side) where the +side of the cap
lead where the cap leaks there is 2 traces that come together on the
+ side of C18. Make sure that they are both making contact I just did
a buddies 850 that was doing the same thing.
Gook luck

Ok, define the problem?

1. No display, usually C18 and the thru hole under it.
2. Scrambled display, corrupt data usually caused by a leaking battery.
3. Dots in the display, caused by a PLL unlock situation.

what device, is your device indicated ptt (via l.e.d.), and still not transmitting... incorrectly wired

is it not indicating, then wrong com port

device make and model would help , wiring in manual is almost the same for all kenwoods

ts440 is pin for ptt with diode to pin 13, but some device do not allow that

Hi Tracy,
That rig has the standard 13 pin Din ACC2 port.

Connections are

Pins 4-8-12 all grounded
Pin 11 has TX audio tones into it.
Pin 3 has RX audio out to the soundboard.
Pin 9 is the usual DATA PTT this mutes the mike if used.

If your connections are correct.
Then check your COMs port number is correct if you are using
the 9 Pin Coms port.
If you are running from a USB with an RS232 adaptor cable you
need drivers added and again the Coms port number set up.

Whiche program are you using
I always. suggest DIGPAN to my customers to get started on.
Are you using an OPTO or a relay for PTT switching

Email me diect if you need more help johnny@...
see www.g3liv.co.uk

I only used an 830 once for a couple hours on FD; never for an extended period of time.

I'm awfully impressed with the 850's receive though.

We had a contesting club get-together last Saturday and several programs were presented. One ham talked about working one of the 160 contests last winter and getting lots of messages from EU stations that they were hearing him but why didn't he work them? He was using an FT1000MP. So he dug out his R4B (I think) and compared them side-by-side. The Drake heard LOTS of signals the MP couldn't even detect. That's pretty disappointing!

I wonder how the 850 stacks up to the Drake line?

Hi Johnny,

I am using a Rigblaster Plug and Play. When I key from the computer the PTT light activates and I hear keying from my headset (which is plugged into the Rigblaster). For some reason the keying is not getting to the Xcvr. Windows (Vista Home Basic) assigns it to Comm Port 7. Ihave been trying this with Digipan, WinPsk and several others. I get the same result with all.

Thanks for help and any other that you might think of.

You would be splitting hairs. My first radio was a TS-830S. It had a fine receiver. No phase noise. The TS-940S reportedly had lots of phase noise. The TS-850S is as good, if not better than the 830. Like I said, you would be splitting hairs. The only thing I didn't like about the 850 was its inability to drive my amp to the point that the 830 would.

Hi, Tracy:

If you're getting a PTT light on the Rigblaster, my first thought is a defect in the keying circuit/wiring harness on the Rigblaster itself, or a problem with the ACC jack on the radio. Have you checked to see that you have continuity between the PTT pin and ground on the Rigblasters plug while the PTT light is on? I've used a Rigblaster Pro with my 690, but I used the mic jack for audio in and PTT.

Hi Again.

When you say the "PTT light activates " do you mean on the
Rigblaster ?

If thats so does the RED ON AIR LIGHT go ON on the TS-850 front panel
I take it, it does not..

You say you hear the Keying in the headphones.
Thats Audio Tones generated within the software progam that should
get
to the pin 11 on the 13 pin. And drive the rig in to RF output.
PTT is a change of state fron NEG volts on Receive to PLUS volts on
TX.

Is Rigblaster using the MIKE INPUT or the 13 pin on the rear.?.

If the PTT is a seperate socket on the back of the Rigblaster can
you put a meter acros it " reading OHMS " if so does it go near short
circuit if you select TX on your Program of choice.

Get back to me again I am in UK so its near 2300BST now so next reply
will be AM Uk time.

VOX is not a good way to go.

Hi Mike,

I have not done any continuity testing yet. I will start to do that and report back later. Thanks

Have you checked to see that you have continuity between the PTT pin and ground on the Rigblasters plug while the PTT light is on? I've used a Rigblaster Pro with my 690, but I used the mic jack for audio in and PTT.

Corrent Johnny,

The PTT light on the Rigblaster activates. The on the air light on my TS690 does not. I am using the 13 pin ACC jack on the back of the radio. Time to break out the meter. Thanks for the help and I will give a report tomorrow

Tracy,
Now we know the audio is getting to the rig from the ACC port the next thing the to check to see if the A. RigBlaster is the PTT going to ground? Pins 13&8 on the 13pin DIN plug or B. Is the cable not connected to pin 13 or 8. You are getting audio to the rig but something in the Plug & Play is not triggering the PTT on the rig. Did you buy the interface New? If so get with them and see if they have any sugestions it could be their mistake.

Hi again Tracy

I am not up on all the Rigblaster models.
But the ones I have seen, you need to set up internal "Jumpers" to
set cable core functions.
I wonder if thats the case maybe check those out again.

There are 2 pins for PTT use on the ACC2 of the TS-850.
Both 9 and 13 will trigger the rig into TX.
However 13 is suggested for Footswitch use if its taken to ground.

While the PIN 9 triggers the rig if taken to ground but also MUTES
the Mike so on DATA there is no need to unplug it.

As one other mentions ,you have got TX tone available so thats a good
start.
I would go for jumpers set wrong if I was a betting man (if it has
them of course)

I dont see the ACC2 port having a problem but you could take pins
9 or 13 to ground using a link to ground and that should put the rig
into TX (ON AIR LIGHT going to RED On) and prove its NOT the ACC2
Kenwood port
for sure.

LINKS has my bet any takers ?

Roland,

I bought this thing new at HRO in Portland, Ore. It came with the adapter cable for Kenwood. the end of the box says "Plug & Play RB/PP/K13D USB Rigblaster soundcard interface Kenwood Radio with 13 pin DIN". I think that the Rigblaster is dead. At least on the send side. The receive side works great. I will try and see if I can figure the plug out. Thanks for the help.

I have for sale a Kenwood YK-88S-1 2.4khz SSB filter. This is the plug in filter that fits in the TS450/690 to give you a narrower 2nd IF (the stock is 6khz at the 8.83 IF). It also fits in the Kenwood TS570 series, as well as the Kenwood TS930/940/950 series. I don't know if it can be used to replace the stock 2.7 filter in the TS850.

I am asking $60 shipped for it. I can take paypal/check/MO.

I picked up a can of Caig Deoxit Fader Spray ($9.99) at Guitar Center
and sprayed my (TS-450) M.CH/VFO.CH switch and for the first time
since I bought the radio the switch is working right. This saved me
nearly $200 from having to send the radio to Kenwood to have the
switch and encoder board replaced. Thanks a lot guys.

Hi John,

I have owned both for extended periods, even side-by-side for awhile. I still own and op my current late serial number TS-850Sat as my main rig, btw.

I mod'd my TS-830S, installing cascaded INRAD 2.1 KHz filters and the electronic switch kit back in the late Eighties or early Nineties. Side-by-side with the new stock TS-850S at the time (it did have the 8.83 MHz IF, 400 Hz INRAD CW filter though), I found the two to be quite comparable in terms of performance. With matched filters in BOTH IF stages, either of these rig's are able and competitive "performance" rigs -- turning in respectable receiver qualitative numbers. Though, the 850 will turn in the better qualitative numbers.

On transmit, both sound great on the air. Signal cleanliness goes to the 830S due to it's pair of 6146B's. Overall capability and usefulness goes to the newer 850S, obviously.

I'll never give up my great 850. It's performance is only matched by new rigs costing 5 to 10 times it's current value.

I am interested if it is still available.

Don (828) 464-5851

--------------- Original message from "John AA5JG" <aa5jg@...>: ---------------

I have for sale a Kenwood YK-88S-1 2.4khz SSB filter. This is the plug in filter that fits in the TS450/690 to give you a narrower 2nd IF (the stock is 6khz at the 8.83 IF). It also fits in the Kenwood TS570 series, as well as the Kenwood TS930/940/950 series. I don't know if it can be used to replace the stock 2.7 filter in the TS850.

I am asking $60 shipped for it. I can take paypal/check/MO.

7218. FS: Kenwood TS690SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-16 21:31:12 UTC
From: John AA5JG
Topic: 7218 Message: 7218

I have for sale a Kenwood TS690SAT HF/6m rig with the autotuner installed. It is a very late serial number-in the 8 million range, meaning it was built in 1996. The TS570 came out in 1996 so this must have been one of the last 690s to be built. It is exceptionally clean also, with just one little ding below the handle but other than that, it looks like it just came out of the box. It also works fine, putting out the full 100 watts on HF and 50 watts on 6m. It comes with the mic, power cord, original manual, and the original box including all of the original packing. You would not be disappointed in the condition of this rig. The autotuner works great and loads up anything you throw at it.

I am asking $555 plus shipping. I can take paypal, check or MO. Or you can pick it up in the Southwest OK/Northern TX area.

Date: 2008-08-17 15:47:14 UTC
From: Jordan
Topic: 7221 Message: 7221

I would also like to know if anyone has tried to control RF output using the ALC line on the TS-790A...

I had hoped to use what appears to be a TX inhibit line at Pin 4 of the ACC 4 connector, but using that pin for control would seem to prevent being able to key the radio using the front microphone connector.

If all else fails, I`ll go the `break-out` from the Mic PTT external line, but I was hoping to find something a little more elegant and inclusive of using a CW key....

Any tips or pointers out there...? 73...Jordan VE6ZT

Hi John

Well, I have a TS-450SAT here and eally like it. I had considered getting a FT-450 as the price seems right, but was talked out of it.

The biggest drawback for me is that it only works RTTY in AFSK in the SSB mode and you can't use the narrow filters for RTTY. I do a lot of RTTY contesting here and that would not work at all.

I like the fact that I can run FSK with the TS-450SAT and use the narrow CW filters.

Also one owner told me that there were way too many menu functions. 73

7224. TS850 digital board!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-18 06:27:58 UTC
From: MM3XXW
Topic: 7224 Message: 7224

Yep, I appreciate this question will have been asked a 1000 times but here goes! [:D]

I need to replace the digital board on my TS850, anyone got one or know where I can source one please?
I'd really appreciate any assistance in locating this piece of equipment.

As for the FT450 v's TS450 [:-?]
What an ugly radio the Yeasu set is, IMHO of course!
I haven't used one personally but do have experience with the TS450, I've contacted a few ops who've used the FT450 and I haven't heard a decent audio out of one yet so for me that says it all [/:)]
Even with the lack of DSP on the TS450 I would put a $3 bet on the kenwood to win in a side-by-side comparison.

Regards,
Martyn

7228. FS: Trac Memory Keyer

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-21 04:10:09 UTC
From: John AA5JG
Topic: 7228 Message: 7228

I have for sale a Trac TE284 memory keyer that would be perfect for a Kenwood TS450/TS690 or other rig without an internal keyer. It does 4 25 character memories, or 2 50 character memories. It will do both positive keying (for solid state rigs) and negative keying (for tube rigs), and runs off of a 9 volt battery. It has had 2 modifications done to it: the tune switch for sending a steady carrier for tuning your manual tuner has been moved to the front panel, and a pot to control the pitch of the sidetone has been added to the back (it was an internal control). I dont have a manual for it but it is pretty intuitive on how to operate it.

I am asking $35 plus shipping, and can take paypal/check/MO.

When I got my new, well new to me!, TS850S it came with the original mic.
It looks like a normal MC-43s (if I remember correct) but on the front just under slats it has 4 very small silver buttons marked 1 - 4.
Now they don't appear to do anything, the ptt works as normal (thankfully!!) as do the up/down buttons on the top but these little buttons are a mystery to me.
Anyone throw any light on this anomoly [:-?] ?

Is it, perhaps, not the original mic but in fact an inter-loper [=D>] from another rig - a VHF/UHF one maybe?

I'd really like to know what the heck these buttons were for!

My secondhand TS450 came with the same type mic.

I still don't know what it does with the '450, but when connected to a KW FM mobile of the TM-231 -241 ilk, the buttons work the same as those on the top row of their included TT mics, whose default functions are: Call; VFO; Mem; and PF(default is MHz).

I do not remember seeing an explanation in the manual, although I confess I haven't studied it that thoroughly.

Everyone finished guessing?

The mike in question is an MC-47, the stock hand mike with the TS-50/60. The buttons are Programmable Function (PF) buttons. They can be programmed to perform menu functions on the TS-50/60. Stock configuration is; 1: Menu A/B, 2: Power level, 3: TF-Set, 4: Monitor.

Aloha Jim,
Take off the top and bottom covers then undo the 2 top screws holding the front to the chassis and tilt foward the front. there is around 5 screws holding and a couple(I think) of ribbon cable(s) gently pull the ribbon cable(s) out and undo the screws holding the display board. You cannot get to the disply from the front.
Replace C18 and make sure all the traces are good.
Good Luck

7240. CAT cable for TS-850SAT with DSP-100

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-27 06:57:57 UTC
From: Mario Aviles
Topic: 7235 Message: 7240

I am trying to hook up my TS850SAT with DSP-100 to my computer. Does anyone have the diagrams on how to build this cable from the transceiver to an USB port on the computer? Also, how is this cable connected if ACC1 which is the RS232 port is used by the DSP 100?

Has anyone tried the SDR-IQ from RFSpace or the LP-Pan as pan adaptor for this radio?

Thanks for your help

Mario/YS1MAE

7241. Re: CAT cable for TS-850SAT with DSP-100

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-27 10:30:32 UTC
From: Peter
Topic: 7235 Message: 7241

Mario

I have no experience of the DSP-100, so cant help you there, other than I understand that the DSP-100 has a "loop-through" for ACC1 on "CONT OUT".

There are plenty of designes for an interface to Serial converter, but none for USB that I know about.
Probably easiest to use a serial to USB converter, or purchase a comercial USB interface. I built a serial adaptor from an internet design, and used the USB to serial adaptor contained in one of the very cheap mobile phone/USB cables available on e-bay.

Finaly I use a "Softrock" SDR reciever connected to the IF output of my TS850 to use as a 100khz (a new soundcard to be fitted should increase this shortly) bandscope (pan adaptor), and it is excelent. The kit only cost $15 from USA (Check Softrock Yahoo group), but i did need to add an amplifier, constructed from two MAR4 devices, to give it more sensitivity to the low IF output of the TS0850.

Now one of the first things I do when turning on the radio is to quickly check the activities on each band with it!!

Regards

peter

make sure main dial is off and there is 4 screws on metal chasis it
should fold over and the panel should pop of with not too much force
good luck n its likely to be dead cap

7243. TS-450SAT No RF Output

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-27 04:09:06 UTC
From: wa4pub@aol.com
Topic: 7243 Message: 7243

Hello to the group!

I'm a new TS-450 SAT group member as well as already being in the TS-440S group.

The problem I'm having with the TS-450 is that I have no drive from the (X44-3130-01) RF Unit to the final amplifier via output of TX mixer Q20 & Q21, TX amp Q19 and AMP Q18 to "DRV" connector 9 of the RF Board.

The receiver works perfectly!

I've determined that the "LO1" (73.15 to 113.05 MHz) injection frequency from the Phase Locked Loop (measured at connector 10 on the RF board) changes considerably when I go from the "receive" mode to the "transmit" mode. Example: With the frequency display indicating 7.2 MHz, the "LO1" cable from the PLL is 80.249 MHz during receive. It changes to 79.50 MHz when I go to "transmit" using the "SEND" button.

On the PLL Unit (X50-3150-01), I can see the loop filter voltage (measured at TP2) go from about 3.5 volts (during receive) to about 3.8 volts (during transmit). I imagine that IC5 on the PLL board may be doing that as a response from the "DIGITAL" unit. All the while though, the "LO2" output from the PLL remains constant at 64.22 MHz. IC6 on the PLL appears to be unaffected.

Note: 1) The rig is in the CW mode with carrier and power controls set appropriately high.
2) On the RF Board, I replaced switching diodes D57 & D59 for the "LO2" (64.22 MHz) injection to
transmit mixer Q45 & Q46.
3) I've been able to follow the output of the transmit amps & mixers through L66, L67, L68 & L89 up
to the gate 1 connections of balanced 3rd TX mixer, Q20 & Q21.
4) I do not have any indication of a loop unlock from IC5 (or IC6), pin 8 on the PLL board.

The one question I'd like to have answered is ...
On a correctly operating TS-450S, does the output frequency of the "LO1" signal from the PLL
remain constant when going from receive to transmit? I'm thinking that it should.

Your answers, comments and suggestions would be greatly appreciated.

My normal email address is _wa4pub@..._ (mailto:wa4pub@...)

73s to all,

Dave - WA4PUB

During receive operation, I am able to

Why are you trying to replace your radiator thru the tailpipe???

Remove the top and bottom. On each side of the METAL frame for the front panel are 2 screws, remove the top one on each side. The front will tilt over and give access to the display. While you are there check the battery very closely for leakage. Any white film on the back side and it needs to be replaced, just tilt it over far enough to see the seam.

FWI when you remove the Main VFO knob there are 2 screws that have to be removed to take off the front panel. That lets you look at the metal frame for the front but won't get you to the display.

What does LO3 do when going from Rx to Tx?
What does DL-0 on the Carrier unit do?

What is the input level to Q20-21 from the filter? It should be abt 75mv P-P.

Clif
You asked "What does LO3 do when going from Rx to Tx?"
Answer: The LO3 is a Xtal cont 8.375 MHz sig that remains constant from Rx
to Tx. Per my Tektronix 2465B scope, it measures 440 mV P-P (311 mV RMS sine).

You also asked: "What does the DL0 on the Carrier unit do?"
Answer: Near as I can tell, it is a 67.05 MHz to 67.55 Mhz sig synthesized
on the Carrier unit (via IC5 mixer) that feeds the IC4 Mixer on the PLL unit
where it is mixed with the buffered (73.15 MHz - 113.05 MHz) VCO1 output.
The output of the IC4 mixer is a is a ragged looking sine sig on my o'scope,
but is cleaned up by a complex filter c/o L15, L16, etc, etc and buffered by
Q17 and Q18, ultimately connected to PLL chip IC5, pin 13 (AMI sig). I
measured this sig w/my scope, now a clean looking (approx 105 nS, about 9.5 MHz sig
at the time of measurement) sine of about 330 mV. Its amplitude decreased

slightly (to 300 mV) when I went to transmit. Sorry, I didn't think to check for a phase shift compared with input signal on pin 5 of the IC5 PLL chip. But, I'll bet there was one ...

I also did some experimenting with the SS (Send Switch and CSS) sig from the IF board to the Digital Unit, connector 4. I found that toggling these sigs to ground produced a change on the PLE1 lead (connector 5 on the Digital Unit) going to connector 2 on the PLL Unit. That lead appears on IC5 PLL Chip. Don't know enough about the logic used here so, I may be chasing a phantom.

Anyway, for now, as I read the CIRCUIT DESCRIPTION, page 8 para 3, LO1 (PLL Loop) I understand (???) that the LO1 output (what ever freq it happens to be) remains constant from transmit to receive.

Is this true? Does your LO1 (on a properly working TS-450S) remain constant from receive to transmit?

Maybe you might be willing to give me your telephone number and I can converse with you on this matter and you can set me straight.

Thanks Clif for your help.

73s,

Dave - WA4PUB

7249. DSP100 + TS850SAT Tuning Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-08-29 17:57:31 UTC
From: dmschertzer
Topic: 7249 Message: 7249

Problem:

When tuning my TS-850SAT with the DSP-100 I normally have the TX button on the DSP-100 to OFF or in the OUT position.

When I press the TX button the the DSP-100 to ON or IN position and try to tune with the TS-850SAT it's almost impossible to reach a SWR.

Weird? Am I missing a set-up procedure?

It will tune noramlly without the DSP-100. Why?

7250. RE: [TS-850_450_690] DSP100 + TS850SAT Tuning Problem

From: Allan
Topic: 7253 Message: 7253

Hi all,
My 850 is a first generation but recently I see some problem with low receive sensibility and I'd like to make this modification :
http://tk5ep.free.fr/tech/ts850/img/ASB1006B.jpg
I have find different type of DC voltage for LFB01 's : 4v. , 5v. , 6v. or 7volt.
What is the better choice ?
Many thanks for any help,
Regards
Allan

7254. Problems with ATU on TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-09-05 01:51:44 UTC
From: Marc Tessier - VE3TES
Topic: 7254 Message: 7254

Hello Group, allow me to introduce myself, I have been the proud owner/operator of my TS-850 for approx 8 years now, I am also an avid RTTY Contester. Ok, I wont bore you any longer, onto the meat of my question.
First I will attempt to describe my problem the best I can. The ATU in my TS-850 will and has no problem tuning any of my antennas on either 10,12,15,17,20,30 and 160M, now on 40 and 80M where I use either my R7 or a 1/2 wave dipole it shows it tunes the antenna up to a 1:1 match in less than 4 seconds on average, and the SWR to start with on 40M in the RTTY segment of the 40M band is a respectable match to start with , in the neighborhood of a 1.5:1, now here is where it gets weird, after a tune of the antenna and it showing me a 1.1:1 VSWR when I attempt to TX on 40M RTTY, it will now show me a SWR of anywhere between 1.5:1 right up to 3.0:1 and yes the VSWR will fluctuate as well, starting at 1.5 then gradually working its way up to 3.0:1, This same event occurs on 80M where my VSWR is a respectable 1.7:1 in the RTTY portion of that band. Now so far I have attempted a factory reset with no difference, and I also attempted the same operation using my Heathkit Cantenna Dummy load and get the exact same results.

Does anyone in the group have any suggestions I could be checking into, or further tests I could do to help me determine what exactly the problem is, I have also replaced the CMOS battery all though I fail to see how it would only effect the 40 and 80M bands, " Oh yes did I say I was desperate?" HiHi...

Regards,

Marc Tessier - VE3TES

Hello Group, allow me to introduce myself, I have been the proud owner/operator of my TS-850 for approx 8 years now, I am also an avid RTTY Contester. Ok, I wont bore you any longer, onto the meat of my question.
First I will attempt to describe my problem the best I can. The ATU in my TS-850 will and has no problem tuning any of my antennas on either 10,12,15,17,20,30 and 160M, now on 40 and 80M where I use either my R7 or a 1/2 wave dipole it shows it tunes the antenna up to a 1:1 match in less than 4 seconds on average, and the SWR to start with on 40M in the RTTY segment of the 40M band is a respectable match to start with , in the neighborhood of a 1.5:1, now here is where it gets weird, after a tune of the antenna and it showing me a 1.1:1 VSWR when I attempt to TX on 40M RTTY, it will now show me a SWR of anywhere between 1.5:1 right up to 3.0:1 and yes the VSWR will fluctuate as well, starting at 1.5 then gradually working its way up to 3.0:1, This same event occurs on 80M where my VSWR is a respectable 1.7:1 in the RTTY portion of that band. Now so far I have attempted a factory reset with no difference, and I also attempted the same operation using my Heathkit Cantenna Dummy load and get the exact same results.
Does anyone in the group have any suggestions I could be checking into, or further tests I could do to help me determine what exactly the problem is, I have also replaced the CMOS battery all though I fail to see how it would only effect the 40 and 80M bands, " Oh yes did I say I was desperate?" Well It sure seems that WW3S hit the nail right on the head, after opening my TS850 and a close examination of the ATU, shows a burnt or cooked toroidal coil, part ref# L110 or Kenwood Part # is L39-0479-05 its listed as a 7MHz toroidal coil. and well its as black as midnight...hihi. I already ordered the part from East Coast Parts and shipped its under 20 dollars, not too bad for my first repair bill on my TS850 after a many good hard worked hours of use...

I will update the group once the part comes in and I have it installed, and I will also at this time like to thank the group for any and all help I received a special thank you will go out to WW3S for his insight into my problem...

73 and best DX to one and all!!!

I purchased a internal tuner for this radio,installed it and have not
got it to work.
I checked all connections, went through all menu instructions on radio
ect.
This is the first and only tuner that has been installed in this radio.
I did follow instructions for installation of a internal tuner on page
#84 of the manual.
It don't click, can't here or see any gears turning, noting lights up
on the display.
It does not seem to be getting power.
Do the power come through the flat cable?
Can't get it to tune!!!!

Thanks

Hold down the enter key and turn on the radio. That's the menu for
setting filters. If #1 is on you have enabled the EXTERNAL TUNER and
the internal unit is disabled. Turn #1 OFF.

Date: 2008-09-08 03:33:08 UTC
From: John
Topic: 7262 Message: 7262

I was using my TS 850 on cw during a very light rain. I heard a pop in the back of my 850.

Now it transmits and receives fine without the antenna tuner switched in. When I activated the automatic antenna tuner, it appears to tune the antenna but when it returns to the receive mode a very strong (S9 + 20) noise is generated in the receiver. Very strong signals can be received if they are above the noise level. If I switch the antenna tuner out, it receives fine.

I would appreciate any help.

>Passando a un discoro piu' tecnico non saprei quale dei 4 cavetti ti
manca, in ogni caso dal service manual o dal manuale operativo del dsp-
100,puoi individuarli e richiederli dove ti ho scritto in
precedenza,tenendo conto che ciascuno cavo è contrassegnato da un
proprio codice di individuazione, assegnato dalla casa costruttrice
kenwood,solo quel codice identifica il cavetto giusto che ti
occorre.Col saldatore anche se sei bravo temo che incontrerai sempre
difficolta' e poi dovresti comunque utilizzare del cavo audio apposito
schermato,mentre i connettori din a 7 e 13 pin sono
facilmente...reperibili compresi i 4 connettori RCA maschi.

7267. TS-450 low pwr on FM, FSK, & CW

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-09-11 15:36:59 UTC
From: Sam M
Topic: 7267 Message: 7267

I have a TS-450SAT that has developed a low power out in CW, FSK and FM modes.
It still has 100w out on LSB, USB, and AM.
all the above tests are running into a dummy load!

Initially it was just a drop in power on 160m CW that I noticed when tuning up.
A slight drop on 80m but was ok from 40m to 10m.
When the rig was turned on it had 100w CW output.
After the rig had been on (in RX) instead of 100w, it fell to about 70w,
then by a few weeks later it was falling to 25w,
and now it is at the point of only enough output
(again we are talking in cw mode) to light one bar on the pwr out meter.
The low output in now on all bands!
But still I get 100w when in SSB or AM on any band.

I was trying to trouble shoot and found
that FM and FSK modes also have the same minimal output.

Has anyone got a clue bone they could throw me?
I don't think it's in the filter board or the rf final board,
since I can get key down 100w in AM into a dummy load
for a significant time with no power lose.

It did seem to be heat related at first, and also there was the frequency
relationship, where it was worse on 160m and better as you went down (or up
depending on your way of looking at it) but now it's so bad that the rig doesn't
even have time to warm up b4 the output is gone.

Sure hope one of you folks can point me in the right direction, I sure like the
rig and would hate to have to shelve it.

Hi everybody,
Just notice a little problem on my TS-850. On SSB receiving I make the filters 8.83 6k and the 455 2.7 k. As I transmit they remains the same. On LSB receiving I notice that when I transmit the filters change. On receive 2.7k 6 k and when transmit they change to 6k 2.7 k. Is this normal or I have something going not good ? For info I have the 2 500 Hz filters installed.
I changed also the PTT but it makes the same.

I know this sounds obvious, but is the "recv/send" button in the top
left
depressed ? there are also ptt points on the back of the rig, that might
have gone to ground - have you got any cables plugged into the rear of
the
850, that are plugged into any accy din or 13 pin plug point ? If so,
remove
them and re-check.

I got this information from this site. I hope it helps

http://n6tr.jzap.com/850repair.html

Radio stuck in send mode - no receive. - submitted by I7ALE

The problem was that when you switched the radio on, in would go in "SEND" status, in any band or any mode. The set was perfectly working, in the "Send" condition, but no way to have it go back to "receive".

After checking out all the most likely "areas" for this problem (microphone port, SEND/REC push button, keyer input, etc.), further analysis of the digital unit X46-3080-A4 and in particular of the IC2 processor revealed that pin 5 of IC2 was LOW, as it should be when the rig is in the SEND condition. This pin is also connected to the SS line, going from IF UNIT to the digital unit and to other boards, among which the BK SW, which is an interface between the CW KEY port and the IF UNIT. It was discovered that the problem was due to a short between the collector and emitter of the "digital transistor" Q3 in the BK SW board, which short forced the SS line to LOW. Replacing the damaged transistor (DTC 124EK) solved the problem.

Topic: 7271 Message: 7278

I have had my 850 go into transmit and stay there.

I think there are two was to put the 850 in transmit, shorting the PTT line to ground and a software command.

I am going on memory but I use computer control so the computer could be sending a software command to go into transmit. If a grounded PTT line isn't the cause try a Microprocessor reset. (You will lose saved frequencies).

POWER OFF

Then

PRESS and hold "A=B"

PRESS Power On

And I just saw in the manual a less severe reset

PRESS and hold RX-A

PRESS Power On

It is page 37 in my manual paragraph 4-11-2B

Hi all,

I had a failure on a TS850 over the weekend where the rig stays in transmit all the time. It occured after about 3 hours of operation. Anyone ever had this happen before?

Thanks,

Terry

It would seem this list is 90% TS-850 orientated.
Questions directed towards the TS-450 or 690 are rarely if ever responded to.

I am looking for help with a TS-450 problem.
If anyone could point me towards an active TS-450 group,
where I might find some help it would be greatly appreciated.

TIA

PS
no disrespect intended, but I am not in need of TS-850 related help.

Hello Sam,

I agree with what you said. I'm a TS-450S owner also and a search for the 450 doesn't bring up much. What is your 450 problem?? I may not be much help but worth a try.

Don, wd0bwm

I tend to disagree on the help end. I respond to all messages I can help with as do the others. Yours is a unique problem that I personally have not seen so I didn't respond. While I have no doubt I can fix it I don't have a ready answer on how you can fix it.

I would help if it were a 440 or 850 but I don't own a 450.

I know a fair amount about repairs to the 440 and 850.

I wonder how many here have a 450?

understandable Clif and I respect your point, however,
a search on the groups site for "TS-450" brings 974 hits
a search for "TS-690" brings 304 hits
a search for TS-850 brings a warning that there are over 5000 results
and one needs to restate your search.

so I believe my comment, that this group is 90% TS-850 orientated,
was in fact incorrect, it's more like 85% or so. ;-)
not that I begrudge TS-850 owners having the excellent support,
I'm just asking if anyone could point towards a more TS-450 leaning group,
where I might have more luck finding answers?

A friend of mine used my TS-450S/AT in a CW contest in C6. He tuned a
40 meter resonant dipole to 80 meters. Tuner flattened it right out.
But, it still burned up the tuner. Just because you get a flat SWR with
the inboard tuner doesn't mean you can't destroy it.

7292. TS850sat - Display Board C18 repair

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-09-18 18:45:50 UTC
From: m0ajm
Topic: 7292 Message: 7292

Hi There - I wonder if anyone can suggest a good way to repair the through holes on the C18 cap, located on the display board.

As the through holes and track were damaged thru the leaky cap, where would be the best place to connect the cap to. I think the (+) side of the cap could go through the hole to the solder side of the board, then a bridge to the second pin of the transformer, but not really sure where to find a good and proper connection for the (-) side of the cap.

Not really an expert on these things, but any advice,suggestions would be much appreciated. Photos would be great.

Many thanks for looking.

73 de Jerry - m0ajm

7293. Re: Problems with ATU on TS-850

Well I generally only use dipoles designed for said bands, and never try to load any antenna that it was not designed for, my tuner went south because my home brew amp does not have a tuned input and I was very green and drove the supreme snot out of it at first, I have since learned to cut back the input power to my amp to say 25 watts still gives me about 400 watts out, more than I will ever require for RTTY contesting...

Regards,

Marc Tessier - VE3TES

Hello,

Has anybody done a modification to the TS850 to reduce the AF hiss
that subsists ? It's more noticeable on the headphones.

73, Patrick

Hello Tony (and others),

When connecting a headphone and putting AF control at ZERO level, i have a small high frequency AF noise. Once noticed, i hear it also when AF level is back to normal...

I didn't notice it before, but the last days i used another headphone which is more designed for HIFI. My usual headphone (HEIL) went QRT during an after contest transportation... It's certainly due to higher bandwith of this later headphone.

One solution would be to come back with another headphone, but the noise is there, despite my old ears... I'm sure my kids who hear frequencies i can't hear anymore, would hate this audio ! hi hi

I don't know if this noise is generated by the audio stages or in IF/RF. I suspect the AF stage, not hearing any RF signal at zero level...

73, Patrick.

Patrick,

I haven't heard the hiss you're speaking of when the AF level is down all the way either. If this was an earlier Icom, with their terrible audio amp sections, I'd say otherwise. But, Kenwood's typically have outstanding audio amp sections, both on receive and transmit.

I suggest that something is amiss with your rig. Perhaps this is a good question for the 850 Master -- Cliff.

Cliff -- any ideas?

73 and good luck chasing this one down,

Steven, NL7W

Hi All,
Have just got my TS-850 (Not AT). Having been used to "Boat-Anchors" such as TS-830S, TS-520, and two FT-101ZDs. Tuning this TS-850 is so different. The old rigs could stand high SWRs with no problem. This rig is the opposite, you have to be so careful tuning it. It will take practice, before I sell up all the older rigs.
Best 73s.

Hi Tim

As far as I know, the AGC is not used in AM mode, the circuit is
bypassed. I have
tried the AGC control on a number of my HF radio's here FT-1000MKV,
FT-890,
TS-2000, IC-7000, IC-706, TS-440, TS-850, TS-50, TS-940 FT-100D,
IC-703 etc
none of them have noticeable AGC control in the AM mode.

Say hi to Dawn

73, John - ZS5J

Tim,

I believe John is correct. Here's what the manual says:

AGC Key
Pressing this key toggles the AGC time constant between SLOW and
FAST.
FAST: For CW, FSK and data communications
SLOW: For SSB and AM.
NOTE: this switch is disabled during FM operation.

Hope this helps. On my 450, in SSB the difference is noticable and
on AM it is not---if there is a difference.

The different AGC settings would only be noticeable on AM if the carrier were fluctuating rapidly in strength.

You should be able to tell the difference, if there is one, when you tune rapidly across a band of AM signals--in fast AGC, the receiver gain should return quickly after tuning across a big signal, while slow AGC would keep the signal level down for a longer period.

I don't have a 450 so I'm not sure if the AGC is switchable or not, but that's how it would work.

To properly test the AGC on AM, tune across some stronger signals in both fast and slow, and see how long it takes the receiver to recover gain....You should find a noticeable difference between fast and slow AGC recovery times....
On my 450S , the times are ~ 4 seconds on slow, and less than .5 seconds on fast, after tuning through an S-9+30 signal....73...Jordan VE6ZT

Jordan is correct there is a problem,If the agc were not supposed to
work in AM the function button would be disabled in the am mode as it
is in fm...Why would kenwood make a silly mistake as to leave it
functioning if it never worked in an mode...I have owned a few 450's
and never had one that the agc would not work on am..Thank's for all
the input gentlemen..KY4HTJ

there is a 4 pin to 8 pin adapter mj84 i think, if your kenwood dealer still carries them. other wise kenwood has been easy to wire

from memory

pin 1 mic audio (on both connectors)
pin 2 ptt (on both)

pin 3 (or was it 4) gnd (on 4 wire) to pin 7 and 8 together(on 8 wire)

check the manuals for both mics it should be easy

7310. TS-850S Audio Hiss

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-09-25 21:59:24 UTC
From: Jordan
Topic: 7310 Message: 7310

I saw a prior question about audio hiss from the TS-850S, and I believe that if you have used a 450S and notice an increase in audio hiss going to an 850S, then I think I know why. The specified bandwidth on the 850S is a little wider than the 450S due to the Slope Tune circuitry when adjusted for broad response....It's the same effect as going from say an IC-761 to the IC-765 with PBT... If you've used one of those rigs, you know exactly what I'm referring to....
Another difference is the audio circuit , which provides much more audio i from the 850S to the 450S...
The indicated BW on the 450S is 2.4khz, whereas on the 850S it is indicated as 2.7khz using the same filters....

I have both rigs, and I can see the difference in the audio hiss level between the 2 rigs....and, believe it or not, it can make the difference between having sufficient recoverable audio on the 450S and insufficient recoverable audio on the 850S... Yes, I have the model numbers in the right place....!

This is just my opinion..... 73...Jordan VE6ZT

Jordan,

That's an interesting point you've made. Now that I think of it, I usually have my high-cut (inner concentric knob) 2 to 4 clicks counterclock from wide-open or fully clockwise -- just to counter what I consider the extraneous or unnecessary high-frequency audio components (I use a JBL Pro III bookshelf speaker which faithfully reproduces all audio well -- no roll-off). The VBT really does work well in the 850, especially if you have matched IRAD filters in both IF stages. The same goes for the older TS-830S.

7312. IF Output Bandwidth on the TS-850S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-09-26 12:47:19 UTC
From: Mike Christiansen
Topic: 7312 Message: 7312

Hi,

Anyone know how wide the bandwidth is on the IF output port on the TS-850S?

Thanks,
Mike, N4GW

7313. Looking For a MJ84 Mic Conversion Plug.

Hi All,
I am looking for a MJ84 Mic. conversion plug/socket. Have just about looked everywhere and cannot find one. There is probably someone out there with a box of 10,00 of these things. I live in the UK but would be happy to pay for one and the postage from anywhere, so please look in your 'junk boxex' etc.
Best 73s.
Ron.

Aloha Ron,
I see them all the time on ebay. Why don't you just get a 8 pin mic.
connector and change out the 4 pin one?
8 pin connector pin out
1. Audio +
2. PTT
3 NC
4 NC
5 NC
6 NC
7 Audio -
8 PTT
It should work great then.

Hi Roland,
Thaks a million for this info will order the 8 pin mic sockets tonight. After years of running 'Boat Anchors' with 8-900 volts on the finals, its going to be a pleasure to work a modern (? Age) rig and doing repairs without one hand glued into a my pocket and a large 'Chicken Stick' (Earthing Rod) always handy whenever I open the rig.
Many thanks.
Ron (GW1HIH)

Topic: 7310 Message: 7316

Hi Steve... Actually, thats how I first noticed the hiss myself... I have a bunch of RS Minimus 7 metal case bookshelf spkrs here that are all black and only one SP-31...SInce I hate sharing spoeakers, I tried one on the 850, and wondered what I had done wrong...I ended up using the Min7 on the 450S, as the 450S has a lower level of background noise... 73...Jordan....

Jordan,

That's an interesting point you've made. Now that I think of it, I usually have my high-cut (inner concentric knob) 2 to 4 clicks counterclock from wide-open or fully clockwise -- just to counter what I consider the extraneous or unnecessary high-frequency audio components (I use a JBL Pro III bookshelf speaker which faithfully reproduces all audio well -- no roll-off). The VBT really does work well in the 850, especially if you have matched IRAD filters in both IF stages. The same goes for the older TS-830S.

Hi All,
Whilst listening on 80 meters in LSB, I pressed the LSB/USB button. Though the little light changed to USB on the screen, I could still receive the signal perfectly well and, it even seemd louder and clearer. Tuning to a R.A.F. Volnet freq. on 5050 Mhz USB I found that it resolved cleare when the screen showed it as LSB. lol Now as I am getting confused, heaven knows what you guys must be thinking Hi Hi.
QUESTION:- How can I be getting a clearer LSB signal when in USB>./ I had better stop before insanity takes over..
Best 73s.

Nothing weird, put the 8.8 filter in 2.4 instead of 6 and the 455
also. In the 6 position they will pass both sidebands.

Hi Ron,

Where do you have the slope tuning knobs set? The outer (smaller) one should be fully clockwise and the inner one should be fully counterclockwise.

could someone please tell me again what I should be checking and where , so I can start digging, schematic spans all 4 pages for the leads from the switch.. can you mention reference points, and which board I should be on

to refresh, the 6 db attenuation cuts almost ALL receive, furthur than the 12 db, and I sometimes think think furthur than the 18 db point

the 6 db att button, when pressed is causing my receive to virtually disappear (too much attenuation, I guess) furthur drop than the 12 db button, which drops it about 4 db (i think), and the 18 db (both buttons) drops it out too, because of the 6 db position, i think

is that enough info.

7329. Kenwood TS-850s with the SM-230 scope

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-10-02 17:01:49 UTC
From: Mike Christiansen
Topic: 7324 Message: 7329

Anyone using the 850 with the 230 scope? What bandwidth can you use on the scope. Does the 250 khz setting give the full 250 khz wide view?

Thanks,
Mike, N4GW

7330. Re:6 db attenuator problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-10-02 20:44:13 UTC
From: Galen Barnaby
Topic: 7324 Message: 7330

I had a problem years ago with the attenuator. (too close to other transmitters). It was a simple SMT resistor circuit and should be well marked. I remember I found it quite easily. Follow the RX signal from the antenna connector. Seems one of my resistors increased in value and another went open.

Try going to the R&T connector on the upper left of the RF unit schematic. Above that is two relays K1 and k2 that if you follow to the right are labeled ATT1 and ATT2. Below the relays are the contacts at r1, r2, r3, r4...check them. I dug out the schematic...

I see them on the schematic of the 850, now I will have to take some time to find them on the board, thanks and will keep you informed when I have success, or blow the radio up. also will need a source for the parts. new place (re)opened in London, ontario, so will be calling them

From: Ronald Ellwood-Thompson
Topic: 7333 Message: 7333

Hi All,
I have a TS-850S and a kenwood miC-60 microphone with no plug fitted. My poor eyesight prohibits me from soldering all eight wires, could manage the following:-

First snip off the up/down wires (Red/Grey/Blue/Orange).
Secondly, snip off th solder tags numbers (2/34/5). This will allow an open space for me to see better to solder the other four. Hope you are all with me so far Hi Hi.

Now to the qiestion. "WILL THE PREAMP STILL WORK AS A PREAMP". Not bothered about the other controls.

Phew ! Well that the problem. All answers greatly appreciated please.
Best 73s.

suggest if 232c or clone, nice one available from g4zlp (call??) off ebay

software (depends on your intention) ve3mij makes a simple software for the 850, many log programs work with the 850, also ham radio deluxe, a search of google I am sure would show much more.... it depends on whether you are trying dx spotting, logging, memory management, or strictly rig control

Hi Dave,
Thanks for the reply. I will look around Google and see whats
available. Was thinking more of rig control, and memory management
etc. Although I must add, this is only an afterthought to using the
TS-850, which I find to be a superb stand-alone transceiver without
any outside help. But it's nice to play around with technology.

Hi Ron,

Here's a simple computer interface you can make with
just a few parts,

http://members.cox.net/kb1gw/850-mods.htm
(scroll all the way down the page)

Once you have this, you could just get a USB/Serial converter
cable or box, which aren't too expensive.

There are lots of Windows programs for rig control,
for Mac users there's the commercial program
MacLoggerDX, which is very good.

The 850 is such a great rig by itself though, and 100 memory channels
are plenty.

I use the IF232 for computer rig control and contest software N1MM. In the small city lot that I have I am fairly close to the antennas and have an RFI problem. The cure was to add RigBlaster Pro for audio and RTTY key line isolation. I tried the Rig Blaster Plus but changing from RTTY to CW was complex. The IF232 provides isolation and level translation on the serial lines. I have a system hookup schematic drawn in Visio and could be pasted to WORD if you are interested.

Hello Everyone,
I have a TS450S that is giving me problems with the power plug on the back of the rig. Sometimes when I move the radio I have to pull the plug and reinsert the power cable into the radio.

Before I get into it I was wondering if anyone has had a similar problem.

I'm no stranger to fixing things, been in the electrical repair industry for 33 years. Just changed the battery in the radio since it started leaking.

check for arcing on the connections.. you have to determine whether it is the cable or socket that is intermintant.. and replace that or both..... check solder connetions inside the radio check crimps, etc....

sounds mostly a visual check

I have used a homemade relay and an AmpKeyer with the TS850 and SB200.
http://www.theheathkitshop.com/page13/_ampkeyer.html
Both work fine.

Has anyone linked a TS850SAT to a SB200? If so, what sort of interface
would I need to protect the '850?

One more time. This is a Kenwood, not an Icom.

No interface needed. The relay is rated 2A @ 30VDC (that's AMPS) and
400ma at 125VAC. I doubt the intermediate keying relay a lot of folks
use is that hefty.

Isn't the Heathkit keying relay voltage 135 volts @ 3 amps?

It's around that. I built a small 12 volt supply to key a relay that keys the one in my SB-200. I use the relay in the TS-450SAT to key that 12 volt relay. The box I built has 3 breakouts so I can key other things if I need to. 73

$27 - cheap peace of mind and if you pick up a backup rig, the amp is ready - regardless of the t/r switch capabilities.

I used to have a TS-830S but upgraded to the TS-850S when the ARRL said it was the best radio they had tested. I wonder what those of you think of the receiver on the 830 vs. the 850? My 830 WAS very quiet. Didn't have the means to keep it around for comparison back then. Too poor. Any comments would be appreciated.

From: Steve Gehring
Topic: 7357 Message: 7358

Hi Steve,

I owned both the 830S and the 850S, and they were side-by-side in the early nineties shack in Biloxi, MS -- while I was active duty Air Force at Keesler AFB. My 830S had matched INRAD 2.1 KHz filters in both IF's, as well as the filter switch kit that switched in the original and wider 445 KHz Murata filter for transmit.

Personally, I found both radios quite equal in capabilities, with my mod'ed 830S possibly edging out the 850S (the 850S didn't have matched filters in both IF's). As far as capabilities go, the 850S won hands down. And, I still own and operate an 850 on a daily basis.

Now that I think of it, I shouldn't have sold the 830S. That was a mistake... I loved its performance, too.

Date: 2008-11-04 16:53:07 UTC
From: John Geiger
Topic: 7359 Message: 7359

I am selling this for a friend, but have used it myself as well. Wish I could keep it myself but funds just don't allow that right now.

I have a top of the line Kenwood HF transceiver for sale. It is a Kenwood TS850SAT HF transceiver. One of the best receivers ever made, according to QST. It is in excellent condition and comes with the hand mic, power cord, and a W7FG copy of the operating manual. It has 2 of the INRAD 400hz CW filters installed, and 1 INRAD 250hz CW filter installed.

I am asking $800 which includes shipping in the US. I would be interested in trades involving a Yaesu FT857D or FT897D. I can sell it for less without the filters. I can take paypal/check/MO.

I would also sell the filters separately if anyone wants to make an offer on them. The TS850SAT is in the 2 million serial number range.

Dave: Thanks for the e-mail
I was just jumping from one filter to another using the filter key pad.
The radio only has the standard filter it came with.
It was receiving and transmitting fine.
I have replaced the battery.
But that was some time ago.
I did a rebut and nothing happens.
The radio turns on and the display is very dim no audio and can go into tx
Let me know if you know what may be the problem.
Thanks1 AE4TO

This sounds like it could be a power supply related problem to me.

It could be a problem with an external power supply having low output
voltage, or a fault pulling down the external power supply voltage.

Alternatively it could be an internal fault dragging down a key
supply rail.

You could try your power supply with another piece of equipment (or
simply measure the voltage with a meter), or try another power supply
(preferably one with a current limiting circuit) with your radio to
eliminate or otherwise this possibility.

If it is internal to the radio, then someone is going to have to get
a screwdriver out and start carrying out some tests!

Shorts or overloads on supply rails often leave evidence, or "emit"
evidence in the form of smoke, or if you are lucky, just a smell!

Hope this helps

Martin

7368. Re: TS-850S Audio Hiss

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-11-14 19:46:21 UTC
From: n4umj
Topic: 7310 Message: 7368

I recently have been doing side by side receive audio performance tests with my new (to me) TS-450 and TS-850 and yes the hiss is very noticebly higher on the TS-850 on SSB. But the high fidelity response on the AM mode is much higher as well on the TS-850 so it's a plus there and I do listening on AM (Broadcast and 75 meters) quite often. The external speaker I am using is an optimus PRO-77 with the tweeter removed.

On SSB receive the TS-850 slope adjustment will trim away an adjacent interfering signal a bit but on the same signals on the the TS-450S it comes out sounding a touch better.

I was puzzled somewhat by the differing 2.4 and 2.7 bandwidths between the two radios and wish the 850 had both available for use. The TS-850 slope tuning seems to get close to attenuating an adjacent interfering SSB signal but the 450 seems to be the winner when I compare the two.

One day I will crack the schematics open and compare the cicuitry between the two.

Having come from using a 746PRO (and other ICOMS) I will say the hiss in the TS850 is no problem to me. I have done many side by side tests with the 746PRO (and PROII) and no matter what I do I can't get rid of the DSP shrill sound... sort of like having an echo from a dixie cup beside the mic. Even the 9 kHz of the AM receive on the 746PRO comes nowhere close to that of the TS-850 or TS-450.

I really enjoy listening to AM on my ICOM R8500 receiver (NO DSP!) and the TS450 and TS-850 are as equal or better. Having sold my TS-440 years ago and switching to the newer ICOMS I had missed out on the newer Kenwoods. I was pleasantly surprised with what I discovered recently! Great work Kenwood!

Ed
N4UMJ

One more note is that both my TS-850 and TS-450 have not been modded yet for the Broadcast band attenuator removal but the TS-450 seems to have the best receive of the two (as much as 15 db higher) in that band hearing many signals. I will be doing those mods to both radios later and can't wait to hear the results....

++
The 440 uses solder in filters and the 450 uses plug in.

7372. Raw/Raspy Audio

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-11-20 07:25:03 UTC
From: subriaus
Topic: 7372 Message: 7372

Hi

I do have a problem that I quite stuck with.
It´s raw/raspy audio. So I did the following actions:

*Replaced the leaky caps on the carrier board. Total of 10 10uf and also
the rest of the caps on that board. Some were leaking and low in value.
* Replaced TC1 on the PPL board
*Realigned according to the service manual 5V on tp2 and 2.3/6-8 on
TP1

Before the actions above I had raspy sigs/audio on all bands.
After the job I have clean sigs on all bands except 1.8 and 3.5 Mhz,
where it is very raspy.So here is were I am stuck.
Could it be that one of the DDS IC 66312 has been damaged by the
leaky caps ?

Any inputs would be of help

I guess you're referring to the 850.

Analyze the problem. TC-1 in LO-2 VCO(Het osc) operates the same on all bands and is famous for that problem but you fixed it. The carrier unit (DDS chips) operates the same on all bands. The 4 VCO's (VCO-1 thru 4) on the PLL unit are banded, IE: VCO-1 covers 30 kHz to 7.4999 mHz and is set using TC-1, 7.5 mHz to 14.4999mHz is covered by VCO-2 and is adjusted by TC2. and on for 2 more, VCO-3 and VCO-4. Each of those is only active in their frequency range.

See where the problem is?

Clif

I have just recently gotten a ts-450sat
Everything works perfectly except the antenna tuner
i have tried both the manual and automatic tuner modes
lights come on rig switches to cw
But no movement from the tuner
the motors don't move

Any ideas on what might be wrong?

Wayne

is you swr ok at that spot, there may be no need to retune. also make sure you car level is high enough to activate the tuner....

some auto tuner will not work below 10 watts drive, some are auto reduced to 10 watts drive. cant remember the 450 type

Hi Wayne,
Could it be that you are not depressing the key/mic in order for the tuner to have a signal to work with.

I believe the connector used on my TS850 for power input [and by extension most other Kenwoods] uses the same crimp pins and connector bodies as most 1990's Harleys...pins should be available over the counter at any Harley dealer...

swr is not ok. Didn't think about the carrier... Tried it with full carrier still no movement. :(

another fella suggested looking under the battery to see if it leaked and ate a trace out of the board. I will check this next.

Ok folks checked all connections and cleaned em. Checked out battery
that did leak and burn out a trace on the board. Fixed the trace and
reassembled.

Tuner works great now!!!

Thanks to everybody who helped.

73 hope to hear ya on the bands

according to the manual it should automatically key and produce a tone.
The on air light comes on when it tries to tune.

7381. Computer Control of TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-11-21 18:23:04 UTC
From: Kevin Nathan
Topic: 7381 Message: 7381

Hi All,

I am new to the group and very strongly considering buying a TS-850 after using my friend's radio last weekend. Right now I have a TS-480 which for me, as a totally blind ham, is very easy to use. I can also control it with my computer and my logging program to send the radio to the frequency of DX spots in which I am interested. I understand this is also possible with the 850 using the Kenwood IF-232 interface. I also understand these are harder than hen's teeth to find. Can I use something like the LCU-3K from Hosenose.com to accomplish the same thing without problems?

thanks much in advance for your assistance and very 73.

Kevin :)

Hi,
If you Google LSU-3K and not LCU-3K they do mention the suitability
of connecting the lead you have to the TS-850.73s.

all late kenwood radios use the same power cable, have you check with the ham shops, the cable are usually around 18.00 or so + mailing. if it is the receptacle on the radio, then check kenwoodparts.com and you manual parts listing to see if they have it...

Hi Cliff

Yes it´s the TS-850

Thanks for the reply, I had a new look at VCO-1 and I did a bad job when soldering the new TC-1
trimmer cap. That fixed the problem
I also changed all the electrolytic caps on the Car and PPL boards and a number
of them was leaking or starting to leak.

Thanks for helping me out.

73/Frank

Subject: [TS-850_450_690] Re: Raw/Raspy Audio

I guess you're referring to the 850.

Analyze the problem. TC-1 in LO-2 VCO(Het osc) operates the same on
all bands and is famous for that problem but you fixed it. The carrier
unit (DDS chips) operates the same on all bands. The 4 VCO's (VCO-1
thru 4) on the PLL unit are banded, IE: VCO-1 covers 30 kHz to 7.4999
mHz and is set using TC-1, 7.5 mHz to 14.4999mHz is covered by VCO-2
and is adjusted by TC2. and on for 2 more, VCO-3 and VCO-4. Each of
those is only active in their frequency range.

See where the problem is?

Clif

search the internet there are lots of programs available, as long as your computer sees the device, the program is your choice. ask yourself???what do i want the program to do???

memory management, rig control, dx spotting all have there differences. logging programs do dx spot to change the radio, but NO memory management, that i know of..

There is some software that comes with the cable. I have purchased 3 of the G4ZLP cables and they all work great. They are plug and play. You just have to set up the software you use for your radio.

I use mine with N1MM Logger, and Ham Radio Deluxe. 73

I had a problem with some oversize sockets on a non-OEM 6 socket power connector with boot that I bought at a Hamfest so be aware that there are multiple sizes available that are very hard to eyeball as being different. I measured one socket being able to accept a 0.070" pin (OEM original) and the other at 0.090(Non OEM)"

The NON-OEM socket size accepting the 0.090" pin will cause some problems of course with intermittent and arcing operations with the 0.070" pins that are in the radio.

The 0.020" is pretty significant

Hi All,

I located and just bought an 850 locally here in the Seattle metro area and so far I love the radio. However, I am blind and the manual I downloaded is difficult to read for me. I wonder if I might address a few questions to the group. Thanks in advance for your understanding.

1. A friend's 850 I checked out last week gave me a lot of CW feedback when I pressed buttons such as the tuner, fine, etc. Mine does not. What do I need to do to enable this feature?

2. How do I get a solid tone for tuning my outboard tuner?

3. Mine does not change sidebands automatically when I go from say 80 to 20 meters even though I have auto set on. What else do I need to do?

4. With my Heil Gold Line mic, I need to set the mic gain full open to get the ALC meter to kick to a good level. Is there anything else I can do or does anyone have a recommendation for a mic with more output that will sound as good and fit on a boom?

I think that will do for now. Thanks again and very 73 to all.

Kevin :)

7396. SSB filter suggestion?

Yahoo group: TS-850_450_690 (2006 — 2009)

From: Ed Thierbach
Topic: 7396 Message: 7396

Hi, everyone --

I used my new-to-me TS-850SAT in SSB Sweepstakes a week ago. It has no additional filters, just the built-in one. I was really impressed with the receiver -- no surprise there -- but also no surprise, I really (really!) needed a narrow SSB filter. After a few hours, I switched over to my IC-7000 for the remainder of the contest. Much easier on my ears, but not nearly as easy to operate when trying to be fast-paced.

What narrow SSB filter would you recommend for contest work? I'm not a "big gun" by any means (more like a pop-gun), but I want to be able to work a very crowded band with less ear and mind fatigue.

Thanks in advance, and 73!

Kevin, I'm not near my manual or radio right now, but I can still help with a couple of your questions.

To get a solid tone for tuning, switch to AM mode and press the Send button. FM will also work, but puts out more power, so AM is preferred.

My Heil headset mic (HC-5 element) behaves the same as your Gold Line. I turn on compression, and set the compression knob about a quarter of the way on. You will need to adjust your compression setting to avoid sounding over-processed; I used the radio's built-in monitor function for that.

Hi Ed,

I have a pair of TS-850s. One has a set of INRAD 2.1 khz filters, the other has a set of INRAD 1.8 khz filters in it. A lot of it depends on how much quality you want in the audio. The 2.1 set is easier to listen too, and with the slope knob, I can narrow it down more. The 1.8 set is not as clear on the audio, but it does work the best in QRM(N), A lot of it depends on how hardcore a contester you are. I like to work contest but never keep track of the points, I just like making a lot of contacts from all over world

I hope this helps some

7400. TS-850 and the LP-PAN

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-11-24 21:57:09 UTC
From: Mike Christiansen
Topic: 7400 Message: 7400

Hey everyone,

I just purchased the LP-PAN to use with my TS-850, and wanted to share my experience with. I thought it might be of interest to the group

http://www.telepostinc.com/LP-PAN.html

My LP-PAN (Kenwood version) arrived Friday afternoon.
I am running a Kenwood TS-850S/AT and an Apple iMac as my computer.
I set the iMac up with Boot camp and booted up under Windows XP.
Hooked up the LP-PAN to the IF port on the back of the 850 and the EMU 0202 USB external soundcard to the LP-PAN and computer.
I downloaded and installed the PowerSDR software. Being a Kenwood, I also installed Ham Radio Deluxe instead of LP-Bridge since the LP-Bridge product is for the K3. It took about half a day and one email to Larry (LP-PAN creator) to install and configure PowerSDR. The instructions were for the K3, so I had to do some trial and error configuration work for the 850

I am very impressed with the performance of the unit. I love having two receivers now in PowerSDR, and click to tune right to a signal is very handy. The the DSP NR works great as well and the audio is very clear. The filtering is great as well. I get 192k bandwidth from the emu 0202 soundcard

It is a good feeling to have a $700 radio do most of what a FLEX radio can do. You can't beat that. My HATS off to Larry for such a fine product.

If you have any questions about my experience, let me know.

73, Mike, N4GW

Item 1 answer: hold lsb while power up this will get into a menu
1 on
2 on
3 on

will give you audible tones/cw

item 2 answer:
i use fsk mode, or the "tune" position on the keypad

item 3:

mine does not either, it stays at whatever mode it was at....

Hi Dave,

I do have those menus all on and don't get the CW except for the modes. I don't have the VS-2 or DRU-2 installed although the VS-2 is coming. Could this function be dependent on either of these accessories? The radio works perfectly, I'm just curious as to why one acts different than another.

Thanks much and very 73.

I have a Inrad 1.8, but its hard on the ears after any length of time...in all honesty,. for SSB, learn to use the slope tuning for adjacent QRM, it works very good...unless you have money to burn, then get a narrower filter....I have 2 850s and only have the narrow ssb filter in the one rig, decided I didnt need it in the second one, and so far dont miss it...

Subject: RE: [TS-850_450_690] A Couple of Questions

Hi Dave,

I do have those menus all on and don't get the CW except for the modes. I don't have the VS-2 or DRU-2 installed although the VS-2 is coming. Could this function be dependent on either of these accessories? The radio works perfectly, I'm just curious as to why one acts different than another.

Thanks much and very 73.

Kevin :)

Item 1 answer: hold lsb while power up this will get into a menu
1 on
2 on
3 on

will give you audible tones/cw

item 2 answer:
i use fsk mode, or the "tune" position on the keypad

item 3:

mine does not either, it stays at whatever mode it was at....

VE3WEJ
Dave Garber

thanks Ed,

I appreciate that info. I'm glad to see it's not just my rig or mic.

Take care and very 73.

Subject: Re: [TS-850_450_690] A Couple of Questions

Kevin, I'm not near my manual or radio right now, but I can still
help with a couple of your questions.

To get a solid tone for tuning, switch to AM mode and press the Send
button. FM will also work, but puts out more power, so AM is preferred.

My Heil headset mic (HC-5 element) behaves the same as your Gold
Line. I turn on compression, and set the compression knob about a
quarter of the way on. You will need to adjust your compression
setting to avoid sounding over-processed; I used the radio's built-in
monitor function for that.

I don;t have the VS-2 and I can hear my CW sidetone. I think you have
to take the top cover off and turn VR5 to turn up the volume n the
sidetone, See page 65 of the manual

I had B&B Tech services do the "Gull Monte on my 850, and they move
the sidetone lever to the Monitor volume knob so you can adjust it
from the front of the rig. Here is the info on the "Full Monte"

http://www.amateur-repairs.com/FULL_MONTE_TS-850S.htm

if you install the circuit vs.-2 you can hear the voice preinstalled
frequency, vs-2 allows you to listen to the voice frequency set on
display.
otherwise the circuit dru-2 that lets you record your call SSB orally
or in cw for telegraphy as a digital audio recorder
For the microphone you use the kenwood mc-60 adapts well to this
transceiver

7411. RE: [TS-850_450_690] SSB filter suggestion?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-11-25 19:42:19 UTC
From: Thierbach, Edward
Topic: 7396 Message: 7411

Thanks for the feedback, everyone. I do use the slope tune quite extensively -- it's the feature I missed the most from my old TS-940 -- but for my ears it doesn't provide quite enough reduction of adjacent QRM when a band's really crowded. I'm guessing that, if the INRAD 1.8 filter works for me, then it'll be worth the money. If not, then I can probably get part of that cost back by selling the filter or radio at some point.

73,

Thanks much. I actually followed Tony's instructions this morning and
things are working fine. I also have refined my mic settings and now my
Heil Gold Line seems to be working well with the radio. I have the mic gain
at about 1:00 and am getting glowing reports of audio and signal strength.

Thanks again to everyone and very 73.

Kevin :)

Be sure to get the 1.8 of 2.1 for both IF's it will make all the
differnce in the world. I have both IF's with Inrad filters and they
beat the Kenwood filters hands down.

I'm a contester and I find the 1.8 kHz filters best for contesting operation. The 2.1 is a little too wide for me.

I agree - the Inrad filters are far better.

Happy Thanksgiving (to our US list members).

Hi,
have bought the interface cable from ZLP which plugs into the ACC socket on back of rig and from there to the computer. So far so good. What I need now is a software program that will reconise the TS-850, and enable me to run rig from computer. Have tried HRD but this always tells me my rig is switched etc. Is there a simple program I can download please.

I've run a pair of matched INRAD 2.1 KHz filters in both IF's, and they work FANTASTIC! In fact they're narrow enough to double as an adequate CW filter. Matched filters ROCK concerning the high and low VBT controls.

Good luck de Steve, NL7W

Ron:

I work with my TS-850 very nicely with the ZLP CAT cable.

Did you connect the cable to ACC1?

Push Connect:

Choose: Kenwood
Radio-TS-850
COM: Choose right COM, VERY IMPORTANT
speed:4800
Check the flags: CTS & RTS

Done!

Any problem drop me a mail, ;-))

Hi All,

I have been contemplating getting the DRU-2 for my TS-850 but in thinking over the problem, it seems it might make a little more sense to buy some sort of outboard device so I could use voice files from my computer. I was looking today at the Rigblaster Plus from West Mountain Radio. Can any of you provide feedback on which type of similar device you have found works best on the 850?

thanks much and very 73.

Kevin :)

Hi Kevin

I don't use an outboard voice box here, but have found that N1MM Logger has a great setup for doing voice files. You can plug the mike into the soundcard and the output of the sound card into the radio and do voice files that way. I do this on my TS-450SAT.

I use Audacity here to record the files, but if you are running N1MM Logger, you can just 'record on the fly' by pushing <sh/ctrl/F-key> and re-record the messages. Pretty handy. 73

I have the dru2, and used it once. it will only hold 3 cw or ssb messages, whereas the sound card voice keyers are only limmited on how many sound bits you created , and the hard drive space to put them.. changing for each contest, save them in individual sub folders, and you can call them up as needed.....

it IS nice the complete the rig with options, BUT sometimes its only to know you did, and not for practicallity

I have a 400 Hz INRAD filter as well as a 250 Hz INRAD for the TS-850S. The 400 is the #104. I wouldn't mind trading the 250 for the other 400 I need. Or maybe both for SSB filters. I also have several Kenwood 500 Hz filters as well as SSB filters that I could trade too.

Kevin,

If you decide to go with the DRU, here is an off brand version you might want to consider. They give you more seconds to record your message on than the original dru

Kevin,

Can you please tell me the right connections, radioPC & PC to radio?

I'm using here Heil Proset HC5 microphone.

Did you used a audio transformer line?

Thanks

Nuno/CT1EEK

Hi Kevin

I don't use an outboard voice box here, but have found that N1MM Logger has
a great setup for doing voice files. You can plug the mike into the
soundcard and the output of the sound card into the radio and do voice files
that way. I do this on my TS-450SAT.

I use Audacity here to record the files, but if you are running N1MM Logger,
you can just 'record on the fly' by pushing <sh/ctrl/F-key> and re-record
the messages. Pretty handy. 73

Hi Mike,

Thanks for that and to Tom as well for his suggestion. I truly want a little more separation than just a quick lash up. I like the isolation offered by some of the fancier commercial units such as the Signal Link or Rigblasters. But, I will also look at this after market DRU. I already have their VS-2 coming.

Again, thanks much and very 73.

Kevin :)

I'm assuming you mean the internal unit Steve, I have the external bhi
'ANEM' connected to my 850 and my name would be "Pinnochio" if I said
it didn't make any difference!
It's like chalk & cheese.

I love my 850 but the addition of the bhi unit has made the difference
between making the contact or not, especially on the higher bands.

Whether it's internal or external if you've the opportunity get it and
install it and ..... well you'll tell us!

Martyn

Can anyone comment on how well this device works with CW?

Specifically, sidetone delay.

I have a Timewave DSP-9+ and it has to have a PTT signal to take
the filtering out of circuit when transmitting to avoid an objectionable
amount of signal delay.

Similarly, I have a CLRdsp module that makes the CW sound 'odd'
and has enough delay to be noticeable. So long as I stay under
20wpm I can get by, but at 25wpm or above, the delay really
messes me up.

Does this device introduce a noticeable signal delay to the CW
sidetone?

Thank you and vy 73;

John N7ZN

unless i missed it, no matter what software you chose, I saw no mention that
you will need a sound card interface before any of this can be done, then
the voice keying is done via the sound card through using the software of
your choice..

then you can use you mike or headset to record audio into your computer.
the voice programs are to retrieve the 'clips' to send to the radio. your
regular voice contacts are made as before, using the mike to the radio plug.

7445. Constantly adjust MIC gain to keep ALC steady

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-12-02 18:24:23 UTC
From: kb3pnc
Topic: 7445 Message: 7445

Greetings! I purchased TS-850SAT a few weeks ago on ebay...you all may have seen it, it was the one listed that had the sharpie marker ink stain on the top cover.

Anyway, after a little TLC the radio looks almost brand new. I've been on the air with it quite a bit lately, and have noticed 2 things that need to be sorted out.

First of all, at full drive the power output runs up to almost 150 watts, with no ALC deflection. If I turn the drive down to about 50%, power output is normal and the ALC works again. So it seems someone must have used their golden screw driver! I can easily readjust that back down to 100W.

Second, I've noticed I must constantly mess with the mic gain to keep my ALC in check. Sometimes there will be no ALC meter deflection until I turn up the mic gain to get it back into the "zone"...then eventually the ALC will become fully deflected requiring me to turn the mic gain back down again.

Is it safe to assume this is probably caused by DC-DC board needing to be modified?

Hi All,

I would like to find a source for low level receive audio out for recording from my 850. By any chance at all, do any of the RCA type DSP plugs on the top of the back of the radio offer audio out?

thanks much and very 73.

Kevin :)

Hi Dave,

Yes, I know that's there but that jack will be taken up with the signal Link
USB I just bought. I was hoping fixed audio might be available somewhere
else.

thanks though and very 73.

Is the SSB Tx audio distorted when going into a dummy load? What band?
USB, LSB, or both?

I doubt it's the caps, look at them and see if they are leaking.

Dang-it!!!I just re-tested with a local[3.800 is where the distortion was reported but I hadn't checked any other bands] and all is fine now but it has been on for at least 45 min. Looking like after it warms up it's OK.Going to turn it off and open the window and cool it off and check upper and lower sideband on different bands.Will be reporting back soon.

7455. Using a 144 MHz transverter with TS850

Yahoo group: TS-850_450_690 (2006 — 2009)

Topic: 7455 Message: 7455

Hi,
I want to use a Microwave Modules 2M transverter with my TS-850S, I have read the TS-850S manual and realise that I can use the IF o/p as 28MHz o/p by re-routing a lead. What concerns me is whether the main PL-259 connector on the 850 will still produce the TX output into the transverter in addition to the drive supplied via the IF socket? I can measure the o/p power down to about 0.5W DC, the transverter's maximum input is 1W DC. Having heard of at least one transverter being cooked with use on a TS-850S, this being by a highly qualified engineer, I would really value any input from members of this group.
Many thanks
Tony G3ZRJ

Hi Tony,
It`s a long time since I did the mod to my 850 and I have
not got the transverter now, but from memory, I fitted a BNC socket to the rear
of the 850, you then run a thin coax lead from the BNC to the SO239 via a
relay, you then run a 12 volt feed to the RF input of transverter. When the
850 sees 12V, it shuts down the SO239 output which then relays the RF to the
BNC. What you end up with, is a setup where your 850 works as an HF Transceiver
until you switch on the power for the transverter, the 850 sees 12volts, and
changes to the BNC output. No switching and changing sockets. I worked great
for me. Someone on the forum must have the exact mod details, but if not
I`ll open up the 850 tell you whats involved. Hope this helps,

Johnny, GM7LSI.

The best way I've found to do this is with the Down East Microwave
TIB-850 (a transverter interface box especially made for the TS-850).

You do have to change the jumper in order to change the output on that RCA
jack fron the IF to 28 MHz. But you don't have to add any other connectors
or do any further mods. Turn off the TIB-850 and the rig will be
connected to your HF antenna through the TIB-850 box.

I used my TS-850S with a DEMI transverter. The output is much less than one watt. More like a half-watt or less. Your mileage may vary. I don't think there is any way possible you are going to see a watt out of it in that mode.
I would highly recommend the DEMI TIB box if you want to switch back and forth between VHF and HF. You only have to flip one switch. Very nice. Without the box, you have to disconnect everything, open the radio up and switch that internal lead.

have you got a TNC connected at rear?
this is known to cause this problem.

Is the SSB Tx audio distorted when going into a dummy load? What band? USB, LSB, or both?

I doubt it's the caps, look at them and see if they are leaking.

Dang-it!!!I just re-tested with a local[3.800 is where the distortion was reported but I hadn't checked any other bands] and all is fine now but it has been on for at least 45 min. Looking like after it warms up it's OK.Going to turn it off and open the window and cool it off and check upper and lower sideband on different bands.Will be reporting back soon.

2a. Using a 144 MHz transverter with TS850
Posted by: "Tony roskilly" g3zrj.morsekey@... fintlewoodlewick
Fri Dec 5, 2008 1:13 pm (PST)
Hi,
I want to use a Microwave Modules 2M transverter with my TS-850S, I have read the TS-850S manual and realise that I can use the IF o/p as 28MHz o/p by re-routing a lead. What concerns me is whether the main PL-259 connector on the 850 will still produce the TX output into the transverter in addition to the drive supplied via the IF socket? I can measure the o/p power down to about 0.5W DC, the transverter's maximum input is 1W DC. Having heard of at least one transverter being cooked with use on a TS-850S, this being by a highly qualified engineer, I would really value any input from members of this group.
Many thanks
Tony G3ZRJ

Hi Tony,
It`s a long time since I did the mod to my 850 and I have
not got the transverter now, but from memory, I fitted a BNC socket to the rear
of the 850, you then run a thin coax lead from the BNC to the SO239 via a
relay, you then run a 12 volt feed to the RF input of transverter. When the
850 sees 12V, it shuts down the SO239 output which then relays the RF to the
BNC. What you end up with, is a setup where your 850 works as an HF Transceiver
until you switch on the power for the transverter, the 850 sees 12volts, and
changes to the BNC output. No switching and changing sockets. I worked great
for me. Someone on the forum must have the exact mod details, but if not
I`ll open up the 850 tell you whats involved. Hope this helps,

Johnny, GM7LSI.

The best way I've found to do this is with the Down East Microwave
TIB-850 (a transverter interface box especially made for the TS-850).

You do have to change the jumper in order to change the output on that RCA
jack fron the IF to 28 MHz. But you don't have to add any other connectors
or do any further mods. Turn off the TIB-850 and the rig will be
connected to your HF antenna through the TIB-850 box.

I used my TS-850S with a DEMI transverter. The output is much less than
one watt. More like a half-watt or less. Your mileage may vary. I
don't think there is any way possible you are going to see a watt out of
it in that mode.
I would highly recommend the DEMI TIB box if you want to switch back and
forth between VHF and HF. You only have to flip one switch. Very
nice. Without the box, you have to disconnect everything, open the
radio up and switch that internal lead.

Just as a wild guess, might there be an RFI issue?

I live on a postage stamp lot and run power, with 75 and 40 dipoles not too far overhead. Had RF getting in the on the mic.

I now have a Rig Blaster Pro with torroids on the internal mic jumpers and in the past, before rig blasters, a torroid on the mic cable. Which seems to have solved the problem.

By the way I am using 77 mix torroids FT 240, 140 and ½ inch.

Subject: [TS-850_450_690] TS-850SAT Distorted Transmit

My TS-850AT developed a distorted transmit problem.RF output is stable.Receive is just fine.Would the caps on the carrier board cause this problem?Is someone selling the complete cap kit for the carrier board?I am needing to change out mine and another one for a friend.If a kit isn't available can someone direct me to what supplyer has them and there part #'s
I have read all this years threads and have realy enjoyed all the technical information the group has posted.Thx's for any hints to what I need to look for.

As I've owned my 450 for a while I thought I should check the battery out. But alas I can't seem to get in.
Took the bottom cover off (full not just the filters cover), nope must need the top off. Upper four screws out but the lid is still tight.

Seems daft to ask, but how do I get in to see?

take off top and bottom covers then take out 2 screws at top front
corners then the whole face pivots down.

The top is just stuck, pull harder. That is if you have all the screws
out, 4 on top and 2 on each side.

Thanks all so far. Yes, I think the top may just be
stuck/glued/magic'd on but I've only got four screws out for the top
cover. Can't see anything on the sides (even removing the carry
handle) unless they are in/behind the little side feet (lhs where you
can stand the rig side on with the carry handle on top).
Has anyone a pic from a service sheet??

Thank you.
Yes it was gripped tight by the bottom cover I'd put back.
- operator error, doh.

Mmm, dusty in there. Looks like I might be first in the top.

Now to find the change it guide. My, it does look tight in there. I do wonder if after freeing CN12 (& maybe CN8) I should just change the battery (if it's clean in there) - I can't really see from here if it'll slide out.

A job for the coming weekend/evenings. Anyone know the original battery type?

7473. Digital Modes

Hi All,

I am interested in running some digital modes with my 850, specifically RTTY, Pactor, MT63 and possibly PSK31. Aside from the stock filters I only have a 250 Hz CW filter in the 455 side. I am using the signalink USB as my interface. Can someone on the list who has run digital modes give me some suggestions please for filter settings and tuning to best use these modes?

thanks much and very 73.

since some modes are very narrow anyway, most receive will be whatever lets it show on the screen. for example psk is 31 hz wide, so putting on the 250 hz filter should still allow you to copy it. rtty is 170 hz wide, so same should apply. whereas sstv is 2.3mhz wide, so narrow filter should be OFF.

I have the 1.8 ssb filter, and it is too narrow for standard sstv, but works fine in other modes. the only drawback, with the narrow filter, is you cant see who is operating beside you ... could be the dx you are looking for

good luck

depends on who you listen too.. the bandplan used to have rtty ALWAYS on lsb (is how i was told) but the advent of soundcard interfacing has stopped users from following that, they are following the bandplan of the band they are on NOT the mode. I on the other hand use rtty on lsb always, but shift from the dxspots (about 2.5 khz)..... psk (bpsk is usb) (qpsk is lsb, but never used qpsk).

most other modes follow the bandplan..

Hi All,

I am interested in running some digital modes with my 850, specifically RTTY, Pactor, MT63 and possibly PSK31. Aside from the stock filters I only have a 250 Hz CW filter in the 455 side. I am using the signalink USB as my interface. Can someone on the list who has run digital modes give me some suggestions please for filter settings and tuning to best use these modes?

thanks much and very 73.

Kevin :)

Hey group, I'm looking for a Kenwood IF-232C with cable. Anxiously waiting to get back on-the-air and haven't since buying my TS-450S this week. Drop me a line if you have one you'd like to unload.

I'm also looking for a good CW straight key.

I'm confused.

I see the IF-232C interface but I also see IF chips* that can be installed. So, if I have one, I don't need the other? Except the CAT cable of course.

I have no serial ports, what modern computer does, and would rather not have to put in a serial card.

What exactly is the best solution for computer control, via USB port?

(I looked around and didn't find an answer, but feel free to point me in the right direction if it's been covered as asked.)

Rather than the IF-232C, go to eBay and search for G4ZLP. Buy one of his cables. I have 3 of them here--2 on TS-450SAT's and 1 on a Yaesu. They work GREAT. 73

Hi, Tooner:

You don't need the IC's for the 450 - those are for the older rigs like the TS-440 and R-5000. If you can't locate a real IF-232, I've had good luck with the IF-232PX made by Piexx. I've used it both with my TS-690 and the TS-790, although I made a cable with a right angle DIN plug to fit the 690's CAT port.

http://www.piexx.com/index.php?main_page=product_info&cPath=7&products_id=23

As far as USB adapters go, they can be a crapshoot - I use Keyspan adapters, which use a chipset made by FTDI. I've heard of people having problems with Belkin adapters but you may need to experiment to see what works best for you,

Hi Frank,

You might look at Hosenose.com. they sell the LCU-3K which is an interface built into the connector of a DB9 with a cable to the radio. It's cheaper than the IF-232C and works great. I bought one for my 850 and have no problems at all.

Good luck and very 73.

I am using my TS-850Sat with Ham Radio Deluxe and DM 780. I am keying the radio with the cw key input. It works great, but I can't transmit on the other stations frequency. When I select the station in the waterfall, the filter pass band is centered 800 kc above the VFO frequency and the transmitter operates at the VFO freq. I have set the XIT 800 cycles above the VFO, no help. Of course if I use MCW, modulated CW in USB, the radio TRs on the same frequecy, but I want to use CW. What I am overlooking. I feel like I am in a forrest and can't see the trees.

Thanks, Ron WR5RR

Update, WhenI set the XIT 800 cycles above the VFO, the TX does shift. I guess I wasn't waiting long enough for the DM780 display to change. I would like to be able to zero beat the rx freq within the program. It seems to have that capability, with the TX lock-split transmit option, but I can't tell any tx difference.

Thanks, Ron WR5RR

Yes I am clicking on the station in the waterfall. I have set my tune at 800 cycles, so that is the center of my passband, 800 cycles above the VFO frequency. The XIT is a good work around, and maybe the only way it will work with the software.

Thanks Ron WR5RR

Tune the station in and press the tune button and zero beat with VFO.
I monitored my TS-850 output with my TS-2000. Yes it was on the same
frequency. It has been awhile since I have operated CW, and I didn't
take into account that the other station was receiving my offset
frequency. I just got concerned when I was transmitting below the rx
freq in the waterfall! Of course I would be!! Anyway I got it now.
Thanks, I'm back on track. Just spoiled using PSK and SSB.

73 and Thanks

7492. Re:Digital Modes

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-12-14 13:42:53 UTC
From: bud Thompson
Topic: 7473 Message: 7492

Hi, Kevin

I've been using a Kenwood TS-850S on digital 24/7 since 1992.

I run a WL2K RMS Pactor station with the radio. (www.winlink.org)

Pactor currently has three speeds, P1, P2, and P3. P1 and P2 will work well within 500Hz bandwidth, P3 requires 2.4Khz for max speed and will not work in 500Hz bandwidth.

WL2K RMS Pactor AFSK uses the standard USB on all bands. In the 850 I leave both 8.83MHz and 450KHz IF filters in 2.7Khz wide for all Pactor work.

(In my ICOM IC746Pro - where the WL2K RMS Pactor CAT can control the DSB filters, 700Hz is a good choice for P1,P2.)

If you have Pactor support with a sound card it will be P1 only as the P2/P3 speeds are proprietary to SCS and the PTC series of data terminals. Actually, I'm not sure if any sound card software will TX Pactor, but some will RX.

Remember that when using AFSK for these legacy data modes (RTTY, Pactor, AMTOR) the actual RF frequency (mark, space) is no longer the dial frequency. Operating "channels" may be designated by Center Frequency to confuse us even more! More confusion is added by needing to select the proper M/S audio tones for sideband filters resulting in the Center Audio Frequency being important!

Center audio frequency of 1.500KHz is a basic standard for these modes when using AFSK - at least for Pactor. This puts the received audio in a good position for the standard SSB filters in voice radios.

The USB dial frequency will be Center RF Frequency minus the Center audio frequency.

Example: Specified channel frequency of 10133.9 KHz requires

USB dial frequency = 10133.9 -1.500 = 10132.4 KHz

I've not yet had experience with sound card modes - but my Xmas present arrives next Tuesday - a Signal Link USB box!

Good luck - you'll love the 850 for digital modes.

73,
bud N0IA

Has anybody on the list here ever had this happen to them.

The word, "HELP" come up on the display?

I was operating the 10m contest on Saturday and had my voice keyer doing the talking and saw the word, HELP come up on the display, so I shut it down,

went to a different radio,

then on Sunday had the same radio my 850 and the voice keyer, and same thing happened, HELP came up again.

Any clues as to what is going on.

Thanks and 73,

Brian

Nothing out of the ordinary, calling CQ contest, which took abt 5 sec, waiting 10 seconds, then calling CQ again.

how long you have in transmitting the final stage?, I remember that
once happened to me because of the long period of time in
transmission.
When you have reactivated the time the transceiver you noticed how
much power was out, because when it goes into protection for
overheating does not go out more 'than 10 watts and reports help, or
you need to check the power source we can' be a lowering of tension

7496. TS-850s Microphone Input Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-12-16 14:32:27 UTC
From: dm4dx
Topic: 7496 Message: 7496

Hi all,

during a contest I connected the Mike Input with the output of the PC soundcard and used this config in connection with VOX as a calling routine. It worked ok, but the last days I noted that when connecting my MC-60 the modulation is distorted.

I think I've overdriven the mike input while using the soundcard... What might have gone bad? I really think that this is a defect caused by the contest setup.

Any suggestions how the problem can be solved? Is there a protection circuit which has to be repaired?

Thanks in advance,

Chris

some sound card connections do NOT mute the front mike , so it is live.. i beleive pin 9 has to be jumpered (via diode) to pin 13 if you are using the 13 pin din like I am for sound card connection.. some interfaces do NOT have that connection.

Thanks for the input Dave, but the problem is that I have a distortion even when the interface is not connected. And that problem hasn't been there before using the interface. So I assume that the problem was caused by too high input level into the "Mike-in" at the radio from the soundcard out.

Hi

This concerns the TS-850

Does anyone have any data on this gas arrestor or where it´s possible to get one. I guess the parts no is KDSA301LA .

Is it possible to put any other kind of transient arrestor (i have some) as a replacement ?

Thanks

Frank

7505. packet radio

I own a Kenwood TS-450SAT and have just recently lost my hearing. Hoping that hearing aids will help here in the near future.

That aside, I think I would like to explore packet, etc. using my 450SAT.

Does anyone on the list know if this can be used for that?

I□m working on obtaining an older AEA 232MBX but it doesn□t have 9600 baud external modem which I will need to look into.

73,

John KD7KFT

You can only use 300 baud on HF so the 9600 baud is mute. As for what Ronald said PSK-31 is the way to go using an inexpencive interface such as the Tigertronics Signalink USB or many others there is many digital modes that far surpass packet. Have fun and 73

Does anyone on the list know if this can be used for that?

any radio can be used for any modes

I'm working on obtaining an older AEA 232MBX but it doesn't have 9600 baud external modem which I will need to look into.

hf packet only uses 300 baud, NOT 9600 for normal packet, so adding 9600 modem added to your pk232 is NOT needed. other modes can be done as well if you have sound card interface etc.

7510. Follow up to '450 access - battery replaced

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-12-21 16:13:40 UTC
From: yah121d
Topic: 7510 Message: 7510

Well many thanks for those that pointed me in the right direction.
Lids off and now (eventually) battery replaced.

Guides (and links to) were very useful (essential really) although a
note to check clearance of filter tops to bench wouldn't go amiss.

My holder on a mini-pcb, expertly heat-shrinked to protect to bottom
terms was a wasted effort - in the end it didn't fit in the gap.

In the end I've fitted the '2032 holder on pcb in the original
battery position and slid a new cr2032 in. Not an easy task.

Main bug bears were:-
original looked fine, measured nearly 3.2v,
pain to get out of the pcb (interference fit pins!) - destroyed on
removal,
original looked fine when removed - not sure this job was worth
doing.

To note, rig seems to have remembered everything. Odd as it stood a
while with no backup and I even shorted the lines proving the holder.

7511. How to directly record RX audio with DRU-2 (TS-850) ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2008-12-26 11:29:43 UTC
From: Thomas Hohlfeld
Topic: 7511 Message: 7511

Hello everybody,
I recently bought a used TS-850 with the DRU-2 unit installed (DRU-2px). It perfectly records microphone input, but I could not figure out how to directly record received audio independent of the microphone and speaker.
The service manual (page 191) indicates that the DRU-2 should be able for directly recording RX audio, provided its input multiplexer (IC1) is switched accordingly via the VOA and VOB lines. Does anybody know how direct recording is activated? Perhaps there is a menu switch I have not recognized so far.
73 and tnx for any helping comment,
Thomas, DF5KF

Sorry,

I hit reply to all.

I promise I won't let it happen again.

I have an SM-220 with a BS-8 installed, that I plan to put up on eBay if
you are interested.

7518. LDG KT-100 Tuner

Yahoo group: TS-850_450_690 (2006 — 2009)

Anyone tried the KT-100 tuner? This is an LDG auto-tuner, outboard, designed to replace the Kenwood AT-300. Works off the front panel of most Kenwood radios. I have a TS-850S (no tuner) and was thinking about one. Much cheaper than the AT-850 and easier to find too!!!!!

7520. really dumb question on ts-450

Yahoo group: TS-850_450_690 (2006 — 2009)

Hello to all,

After all the years I have owned my TS-450S, I just noticed something I have to ask about that I don't see in the manual. I use a paddle and MFJ keyer for CW and have for a long time. Works fine.
OK, with the Keyer plugged into the back of the rig, and mode in CW and carrier up, I cannot key the rig and check output using the Send-Receive button on the left side of the rig. I have to use the key to do this. If I unplug the keyer from the 450, then the Send-Receive button works to check power out.

Is this correct??

Thanks for any input,

Don
